The plant is said to be common on damp rocks in Ankanfa (Madagascar). The plant is distinguished by the one or two conspicuous flowers, much larger than any of the others in the genus. The tubers are 1½ inch long; the leaves are dark green, with brown spots. The flower varies in colour considerably; apparently the commoner form has green sepals, with dark red spots and white petals; the lip is purple, with darker spots at the base, and 2 inches long by 1 in diameter. In the other form the lip is white, with a purple blotch at the base, and a few pink spots on the underside at the tip. The pollinia are green, and have very long slender pedicels, and the pink anthers, the corresponding long arms characteristic of the genus. The spur is long and straight, and the terminal half is suddenly dilated. The above descriptive notes are condensed from Mr. Ridley's paper. In the cultivated plant the colours are as given in the legend to fig. 29.

CULTURAL MEMORANDA.

MARECHAL NIEL ROSE.

If cuttings of this popular Rose are taken off at once with a heel, i.e., a piece of the old wood attached, and inserted in 4½-inch pots, having a few pieces of potsherds in the bottom, with a bit of rough loam over them for drainage, and filled to within an inch of the rim with sandy soil, made firm, and afterwards watering through a rose to settle the soil about the cuttings, and placed in a forcing-house or pit, they will soon root. They should then be potted singly into 3-inch pots, watered, and again put into heat, giving them a position near to the glass. Subsequently shift the plants, as they require more space at the roots, into 6-inch and 9-inch pots, affording good drainage and rough substantial loam to grow in. Give plenty of water at the roots when required, and cut all lateral growths or side-shoots out as soon as they appear, thereby concentrating all the energies of the plant into one leading growth, which being allowed to grow uninterruptedly, and being kept well supplied with liquid manure at the roots during the summer and early autumn months will attain to a length of 15 or 20 feet by the end of October next. We have some which have been so treated that are now 25 feet long, trained up the trellis on the back wall of a Fig-house and down again to the 9-inch pots in which they are growing. These will be shortened back considerably forthwith, and started into growth, bringing the points of the rods down in a semicircular fashion almost to the ground, to secure every eye or bud pushing into growth along the entire length of the rods. *H. W. Ward.*

FORESTRY.

SEASONABLE WORK.

Now that the cones of the Scotch Fir and Larch are thoroughly matured by frost, they should be gathered in dry weather, and the seed extracted, so that it may be ready when wanted for sowing in April. I may explain that although the cones are ripe in the autumn, yet by allowing them to remain exposed on the trees during winter the action of the frost loosens the scales considerably, so that the seeds can be extracted by a less degree of heat, which is an advantage in more ways than one. In the natural forests in the Highlands of Scotland my practice has been to collect the cones in February and March, and by placing them on flat flag-stones heated by the rays of the sun the scales gradually open, and allow the seed to drop out. This is a very safe way of extracting the seed, as there is no risk of their vegetative power being impaired by overheating. In cases, however, where large quantities of seed are required, the cones may be placed some 6 inches deep upon a wooden kiln, and the temperature raised to about 110° Fahr., which will be quite sufficient for opening the scales without in any way blunting the vitality of the seed. In many parts of the country the plantations are mixed with an inferior variety of the Scotch Fir from the Continent, viz., Pinus sylvestris haguenensis; therefore, the planter should exercise his judgment in the selection of his cones, and only gather such as are produced by the true Highland Pine. The continental variety grows very well on sheltered situations, but when planted on wind-swept heather ground at high elevations in these islands, exhibits a brown stunted appearance, which rather an eyesore than an ornament, and as never attains a profitable size under such conditions, it should by all means be avoided. In gathering Larch cones, great care should be taken to select such as are produced by fine healthy trees free of ulceration, canker, rot, or blemish of any kind, as the cones on healthy trees are always well developed, and the seed of superior quality. Diseased stunted trees generally produce a great wealth of cones, and as they can be gathered from small trees with less trouble than from healthy ones of a larger size, they are very tempting to the collector who is often paid by quantity. In cases where only a small quantity of seed is required the cones may be split up mechanically to allow the seed to drop out, but in all cases where any considerable quantity of seed is wanted the cones had better be dried on a wooden kiln, and then removed when in a warm state, and placed on a hard floor where they should be beaten with flails or other suitable implements to extract the seed. The cones of other hardy coniferous trees should now be gathered, and the seed extracted in a similar way.

The Preparation of Seed-Beds.

Dig, trench, and prepare ground so that it may be ready to be formed into seed-beds when wanted in April; and in cases where the nursery plots have become exhausted, take advantage of dry frosty weather to cart fresh soil to improve their texture. If not already done, finish the sowing of Acorns, Chestnuts, and the berries of the Yew, Mountain Ash, Hawthorn, Holly, &c., which were stratified in rot heaps last summer; and in favourable weather towards the end of the month sow Beech-mast, Elm, Sycamore, Ash, &c. In favourable weather push forward the planting of forest and ornamental trees on dry ground, and prepare cold stiff clay and peat-bog for spring planting at a later period. Plant cuttings of deciduous trees and shrubs usually increased by that method, such as Elders, Willows, and some of the Poplar tribe, &c. Plant out seedling trees and shrubs into nursery rows, and transplant such as are too crowded in the lines to afford additional space for their development. In preparing heather ground for planting, it is sometimes necessary to burn the heath and surface-scrub a few years before planting is commenced, and in doing so the surface-scrub may be burned any time during dry weather in spring up to April 11, when the grouse generally begin to nest, but that time is sometimes extended for fourteen days when all parties concerned are at one on the subject. *J. B. Webster.*

The Apiary.

BEES-WAX.

Care should be taken of all scraps of comb about the apiary, to be melted down. If a box is set apart for the purpose of keeping them in, there will be no excuse for throwing any away, which often happens when a receptacle is not provided. The box should have a tight-fitting lid, so that the wax-moth cannot deposit her eggs, also to keep out bees as well. When a sufficient quantity of comb has accumulated for melting, it will be necessary to sort it, so that the light and the dark pieces may be melted separately. The former will yield wax of beautiful colour and purity fit for exhibition, or it may be made up into super-foundation. Wax extracting is one of the departments of bee-keeping most suitably carried out in the winter evenings, for if it is done in the summer when bees are flying, the aroma of the molten wax attracts them in large numbers, so that they get into the house and become a nuisance. Good bees-wax generally fetches about 2*s.* a pound, and if there is no sale for it at this price, the bee-keeper will find it most to his advantage to send it to a foundation manufacturer, if the cost of carriage is not too great, who will make it into foundation for him at the rate of 6*d.* per pound. Why then cannot bee-keepers make up their minds to supply themselves from their own bees with wax enough to make sufficient foundation for each year's requirements, as the purchase of this article is one of the most expensive items that has to be provided for. A good plan for extracting small quantities of wax without the aid of a wax-extractor is to tie the combs in a calico or flannel bag, which place in a colander in the oven over a bowl of water.

Weeding-out Combs.

Combs are to be found in most hives every year that require weeding-out by reason of old age, irregularity, or through their containing too large a proportion of drone cells. The best plan to effect this is, when examining stocks in spring to move the imperfect cones to the outsides of the cluster of bees, and gradually work them out of the hives by introducing at intervals frames containing full sheets of foundation in the middle of the brood-nest. *Expert.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

STRAWBERRIES.—Take advantage of fine dry weather to clear the plants of dead and decaying leaves and runners. Any gaps in the lines should be made good, and "blind" plants amongst those planted in the autumn should be thrown out, their place being filled with others from the stock of forcing-plants, or from the reserves. If these are carefully transplanted at this season with good masses of roots and soil, there will be little difference observable, and the beds will have a uniform appearance. This finished, hoe the land, and clear off weeds, after which afford the beds a dressing of fresh soot, more particularly just round about the collar of the plants, which is all the top-dressing that will be required for the present. It being now generally accepted that new plantations of the dessert varieties should be made biennially, it is surprising to observe some gardeners still persisting in giving Strawberry plantations a heavy dressing of rotted manure in the autumn, the idea being that the manurial ingredients of the same are washed down to the roots by winter rains, which so far is correct. But the mischief wrought by thus providing shelter for slugs must be obvious to all. Hence, where such has obtained, I advise the clearing off all the manure, and dressing with soot, as advised above, when, if the ground is dry, and the soot is fresh, the number of slugs which will be found dead will speak much for the practice. Instead of affording dressings of manure, our two-year-old plantations are treated to frequent soakings of manure-water in mild weather during the winter.

PREPARATIONS FOR GRAFTING. — In most gardens there are varieties of Apples and Pears which do not give satisfaction, and, except in the case of worn-out trees, it is a saving of time and labour to regraft such rather than to replace them with new trees. The scarcity of fruits at any particular season will determine what varieties should be chosen as grafts. Late Apples of good quality are most needed. Of such, Cockle Pippin at this part of the season is hard to beat if the weather in the autumn was such as to favour leaving the fruit on the trees till the end of the month of October, or it was otherwise favourable to their thorough ripening. Claygate Pearmain is in some respects the superior of Cockle Pippin, and I cannot too highly recommend the variety for late dessert use. In the case of old trees, and those with cracked and unkind-looking bark, it is more satisfactory to prune them back from one foot to half a foot from the main stem, and whip-graft on selected shoots of the resulting young wood next season, or bud the same in the late summer. Shoots intended for scions should be obtained forthwith, and heeled-in on a north border, or in a cold moist cellar. Do not make them up into bundles, but lay them in singly, so that the moist soil may be in touch with them. Withered shoots never make good grafts.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

WORK IN THE HOUSES.—The time has arrived when the re-potting and top-dressing of Orchids must be pushed forward, and at this season it is always a matter of choice which shall be done first. Lælia anceps and L. autumnalis are now forming fresh roots, and these should be re-potted amongst the earliest taken in hand. These species need not be re-potted yearly; in most cases every second or third year is sufficiently often, providing the plants are doing well. Lælia anceps Sanderiana, L. a. Stella, L. a. Schroderiana, and L. a. alba, which are varieties that are chiefly grown in baskets, will not require to be turned out of their receptacles, but the old material should be carefully picked out from among the roots, and replaced with new compost that may consist mostly of peat, a very small quantity of sphagnum moss—just sufficient to indicate when the plants require to be watered, in which concern I would remark that very little water is needed for the present, an excess of moisture just now often causing the root-points to decay. The same kind of treatment that is suited to L. anceps will be found adapted for L. autumnalis and its variety Gouldiana and others. The typical L. anceps does better in pots—in fact, the use of baskets should be limited to the more shy-flowering species and varieties. In repotting L. anceps, much pot-room is not required, and it is better to err in using a small pot than a large one, their roots being mainly aërial. Any newly-imported plants are better if placed in clean pots and crocks only, until such time as they have made plenty of roots; and before potting them, let them be well-washed and looked over, an injurious weevil or beetle being frequently brought over with the plants, which is got rid of with much difficulty. I heard of a gardener who was troubled all last summer with some of these marauders, which are again making their appearance amongst his Orchids. The insect is generally to be discovered on the undersides of the leaves, and as soon as the plants are touched it drops either on to the stage or the pot, and being nearly the colour of the outer sheathing of pseudobulbs, it is soon out of sight. Standing the plants on inverted pots is a good plan where these weevils abound. I believe this insect was figured in these pages. Vanda Amesiana and V. Kimballiana must be looked over and top-dressed with fresh sphagnum moss. To grow these two species well, and flower them satisfactorily, I find the cool end of a Dendrobium-house, well exposed to light and sun, the best place for them. Ours never got any shading at all last summer, and Epidendrum radicans got the same kind of treatment, and this plant is now flowering freely. When V. Amesiana is well grown and ripened, some growers advise an intermediate-house temperature for it, but it really does better in the Dendrobium-house, as does V. Kimballiana, affording both plenty of water whilst growing.

FRUITS UNDER GLASS.

By Jas. Whitton, *Gardener, Glamis Castle, Glamis, N.B.*

PINE-APPLES.—Now that we are getting more sunshine, increase the minimum day and night temperature by 5°. Prepare composts for potting-on young stock. Fanciful compounds are unnecessary. Where a good turfy loam is available, nothing else is required beyond a little bone-meal. Do not break the turf into too small pieces, and if the soil is of a light sandy description, sift out and reject the finer particles. Should the soil be of a heavy clayey nature, add sufficient lime-rubbish, charcoal, and quarter-inch crushed bones, to keep it porous; the Pine-apple detests a sour soil. Further, if the soil is of a poor quality, add some good plant-fertiliser; Thomson's is still one of the best, using the proportions as given by the vendors, taking care not to overdo the mixture with these. We occasionally see plants getting too much of a good thing in the way of artificial manures, we presume in the anxiety to produce something phenomenal. See that the soil is in proper working order before potting. An experienced hand knows at a glance when the soil is in proper order. A simple method for young men is to test the compounds by taking a double-handful, give it a good squeeze, and lay it down on a bench. If it falls down, it is too dry; should it hold together without breaking, it is too wet. The medium and proper state is thus very easily learned. See that all pots and crocks are clean and dry. For Queens and such medium-sized growers, 10 or 11-inch pots will be ample. Smooth Cayennes, and the larger-growing sorts, will require a size or two larger. I never saw any gain in using larger pots than those stated in which to fruit Pine-apples. Pot neatly and firmly, and replace the plants in a bottom-heat of 75° to 80°. They will not require water for a time, if the soil was in proper order. Damp the house regularly, and keep a genial growing atmosphere; a night temperature of 65° to 70° will be ample. Watch carefully those plants showing fruit and in bloom, and see that they do not suffer from want of water; a check at this stage is productive of deformed fruits.

MELONS.—See that the soil is warmed and in good order in the beds before planting the early sowings, so as to avoid giving the plants any check when setting them out. Where beds are not available, or bottom-heat therein deficient, the difficulty may be overcome by growing and fruiting the plants in pots; indeed, many good cultivators use large pots in preference to beds, and where soil is scarce, or of indifferent quality, there is a gain in such procedure. Use pots 18 inches and upwards in diameter. Drain them well, and ram the soil firmly. Turn out the plants carefully from the smaller pots, and plant carefully in the larger, leaving sufficient room for watering and top-dressing. Set the pots properly, and put a stake to support the plant up to the trellis. Allow the main stem to grow to the full height desired without stopping, and then pinch out the point. The laterals may be rubbed off when at the bud-stage on the lower part of the stem, taking care not to injure the main leaves. The laterals which start opposite the first wires of trellis must be allowed to grow; these will show fruit at third or fourth leaf from the main stem. Once the fruits are seen, pinch the buds beyond, so that all the energy may be directed to the fruit. Watch daily for the opening of the female blooms, and fertilise them, allowing them to be fully developed before so doing. The pollen on male blooms is usually at its best on the second day after opening at this season of the year. Sow for succession crops as requirements demand. The usual calculation is to allow from twelve to sixteen weeks from time of sowing to ripening of fruit, according to the season, and other conditions.

CUCUMBERS.—A brisk heat of 65° to 70° at night must now be maintained to get quick growth so essential for first-class Cucumbers. Ventilate carefully on sunny days, but guard against cold draughts. As the plants grow, pinch the shoots at every second or third joint, and thin out the young fruits if more than two set at a joint. Though usually the removal of deformed fruits keeps them thin enough, if the fruits are cut when ready one can leave most formed. Towards the end of the month prepare a hotbed for growing the supply in frames. There is not much gained by having these made up before April. For general purposes our favourite is Edinburgh Beauty, a variety of medium size, good quality, and very free fruiting. It was sent us on trial by the raiser some seven or eight years ago, and has never failed to be very satisfactory. For exhibition purposes any of the Telegraph type are good. Perhaps Lockie's Perfection is the best—at any rate, it is the best I have seen.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

VIOLA TRICOLOR AND ITS VARIETIES.—These plants, under several popular names, have long been cultivated in our gardens, being favoured alike by rich and poor; a matter not to be wondered at, considering the ease with which all of them may be grown, the diversity of colour and markings the flowers exhibit, and the floriferousness of the plants. They are easily propagated by seeds and cuttings, also by division and layers. Seeds should now be sown in pans of light friable soil, and placed in a gentle heat, or even in a cold frame, where germination soon takes place. The seedlings should be pricked off into boxes or in frames when they are large enough to be handled, and planted out in the open ground in April. These seedlings will flower freely throughout the summer, and will scarcely be less ornamental than named varieties. Cuttings may also be put in at this season, although they strike more readily at the end of the summer; still, good results may be obtained from cuttings if a little extra care be taken, for where a large stock has to be kept up it will be found necessary to keep on putting in cuttings all through the season. The soil used should be of a sandy nature, and it should be pressed firmly round the cutting at the time, and if they are placed in a slight heat they will root much more readily than in a cold frame at this season of the year. Plants thus obtained may be placed in their permanent quarters in the autumn, or in a prepared border, with a view of lifting them again with better roots and with balls of soil—an essential point in planting Pansies. Pansies for ordinary decoration will thrive in almost any garden soil, provided the position is not too hot or dry; but a rather cool moist bottom and cool moist air are best for them, which is one reason why these plants thrive better generally in the northern parts of Britain than in the southern. In the case of choice varieties, it always pays to have specially-prepared beds for them, as they then produce flowers of greater size, and the flowering season is also somewhat lengthened. And it is nearly a necessity to have such beds if exhibiting is followed, as only large flowers with properly developed features are of any use. In preparing the beds, which may be done at the present time, plenty of fibry loam, thoroughly-rotted cow-manure or horse droppings, and sharp sand or road grit should be dug and mixed with the staple, and it is a good plan to have the beds sunk 3 or 4 inches below the level, if the soil be naturally dry; and then, if they are planted fairly deep, the roots are placed in a cooler and moister medium than if they were shallow-planted. A mulching of old potting-bench soil, leaf-mould, and rotted stable manure should be afforded before the flowering season commences, and another at the end of the summer. When watering is necessary in the summer, it should be thorough, and it should be undertaken in the early morning or evening, preferably the latter.

GENERAL HINTS.—The most important matter at the present time is the completion of the planting of Roses and deciduous shrubs. Roses which have been covered up may now be exposed, especially the Tea Roses, for the sooner they see daylight after this date, the better, the retention of protecting materials keeping the soil cold, and sometimes injuring the buds. A few of the roots may be pruned forthwith, so as to obtain early bloom, but the bulk of the pruning should be deferred for a few weeks longer, otherwise late spring frosts may play havoc with growing shoots.

CALCEOLARIAS may be transplanted from the boxes or hand-lights, where they were struck in the autumn, into cold frames, employing a soil consisting of loam, leaf-mould, and sand. Plant them 4 inches apart, and pinch out the points occasionally as growth progresses, and admit plenty of air after the plants have started to grow.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

ACHIMENES, GESNERAS, AND TYDEAS.—Pot off the tubers before they start to grow, affording them a compost of partially rotted leaf-mould and good peat in about equal parts, with plenty of silver-sand added, and a small quantity of dry cow-dung. The pots or pans should be well crocked, and these, after planting them with the tubers, may be placed in a cool house or close shed, starting them on in batches, according to requirements, covering the pots meanwhile with Cocoa-nut fibre refuse. Achimenes for placing in baskets should first be potted in 60-sized pots, this being a handy size for planting out.

IXIAS, SPARAXIS, BABIANAS, TRITONIAS, and similar Cape bulbs, which were stored away, may now be brought to the light, and afforded water. Tritonia crocata aurea becomes a useful plant when grown from twelve to twenty bulbs in 8 and 10-inch pots. Started at this season, it will flower in July and August. As potting soil use loam, leaf-mould, and plenty of sand, and whilst in full growth, liquid manure should be supplied; it will do very well if left undisturbed for several years.

SELAGINELLAS AND LYCOPODIUMS. — These species will require attention during the present month. When S. denticulata is used for an edging in conservatories and other structures, vacant places in these should be made good before warm weather comes. Sometimes it may seem better practice to replant entirely, in which case the margin of soil should be renewed, or a considerable amount of rich loam, rotted manure a quarter of the whole, and sharp sand added to the old soil. Hardy Ferns may be re-potted or top-dressed, and the drainage of the pots made good. The deciduous species that were put away for the winter should be brought to the light, and receive a watering. A very useful evergreen Fern is Polystichum angulare. P. proliferum Wollastoni should be grown in quantity in small pots.

STOVE PLANTS.—When it is required to increase the number of the varieties of Dracænas and Crotons, those plants that have got naked at the bottom should have a few leaves and a portion of the bark taken off the stems, and be bound round at the spot laid bare with sphagnum moss. Treated so, they soon form roots, if kept in a moist stove, and their roots are seen to be pushing through the moss; the tops may be cut off, and potted, making good plants at once. The remainder of the stems of Dracænas may then be made into cuttings, or eyes, as Vines are propagated; and the Crotons will break below the point of severance, and make large plants.

CYPERUS ALTERNIFOLIUS.—The head of leaves of this plant, with a small portion of the stem, will strike well in 3-inch pots filled with good soil and sea-sand, in a warm pit. The plant when grown in small pots is useful for table-decoration, &c.

COLEUS, ETC.—These plants may now be pushed on in heat, and cuttings taken as soon as these are obtainable. Put the cuttings one in a 3-inch pot, and plunge in mild bottom-heat, in a propagating-frame. Seeds of Coleus may be sown in heat, also those of Streptocarpus and Tree Carnations, in mild bottom-heat.

VIOLETS in frames, that have not been watered for some time, will be benefited by a thorough watering sufficient to get to the lowest roots; remove the lights when the weather is mild for a time during the day, or tilt the lights sideways with a block.

MIGNONETTE.—Attend to the August and September sowings, and afford a small pinch of Clay's or Standen's manure before watering the soil, which will assist the plants greatly; do not stand it on slate shelves. A wood, coal-ash, or sandy bottom is best; maintain the temperature at from 45° to 55°.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

FORCING ASPARAGUS.—In all establishments with any pretension to completeness, a supply of forced Asparagus usually has to be provided, and for this purpose a sufficient number of roots must be grown, as it is difficult to get very early supplies from the permanent beds. But where such beds have been made for the express purpose of forcing, they may now be started into growth. A temporary frame, of sufficient size to cover the beds, may be made with ordinary flooring-boards, and if a few square posts be driven into the ground, and the boards screwed to them, the frames may be easily taken to pieces, and used similarly for covering another bed, or part of one. Asparagus-beds forced in this manner should be made near the frame-ground, in such a position that the littery appearance of the beds would be less conspicuous, and the labour connected with the fermenting material would be less. Those who have to lift a large quantity of roots each season for forcing should take the first opportunity, when the ground is in a workable condition, to make new beds. In soils naturally well-drained, there is not much difficulty in doing this, but on cold, heavy land, special preparations are needed, or the roots will rot during the winter; and in such soil, beds raised considerably above the ground-level are best. It is yet too soon to sow Asparagus seed, but the beds should be got in readiness before the beginning of the busy season.

TOMATOS. — Plants raised from seed sown a month ago will now require to be potted. The soil used should be light, and fairly rich, and the plants, after being potted, should be kept as near to the glass as possible without actually touching it. Those large enough for planting out, or putting into their fruiting-pots, should be kept no longer in the small pots than can be avoided. A dry warm atmosphere suits the Tomato, especially after the plants have begun to flower, the fruit not setting well in damp air.

FRENCH OR KIDNEY BEANS.—Make another sowing in heated pits, and failing these, the seed may be sown in pots, and placed in a vinery just started. Keep a sharp out-look for red-spider, otherwise this troublesome pest is apt to get the upper hand. When Kidney Beans are grown in pots, they should have roomy pots, six plants being a sufficient number for one of 9 inches. The plants should be about 1 inch from the side, and a few sticks inserted to keep the plants erect.

CELERY.—Make up a slight hot-bed on which to sow Celery seed, taking care to have the material well turned over before being made up, so as to bring every part of the bed to a uniform temperature on the surface; and after the heat has been tested, and found not to be too high, say, 80°, a layer 4 inches thick of light rich soil should be spread evenly, and soon afterwards the seed may be sown broadcast, a very thin sprinkling of fine soil strewn over it, and be slightly patted with the spade or a piece of smooth board.

CAULIFLOWERS.—Those sown early in the year will now be large enough for planting in frames, put over slight hot-beds, and the sooner this planting is done the better, the plants receiving but little check thereby. At the same time much valuable space would be wasted if only those intended to remain till fully grown were planted. It is therefore best to carefully prick out the young plants from 4 to 6 inches apart, lifting some of these with balls of roots and soil the first week in April, and transplanting them on a warm border out-of-doors, allowing the others to grow on to form heads on the hot-bed.

HERBS.—Examine herb beds, and fill up deficiency, if any, making fresh plantations, or getting beds made for sowing seeds later. Sow Parsley and Chervil in the open ground on warm dryish sites.

SALADS.—Lettuces that were sown in heat will now be large enough to prick-out 2 or 3 inches apart according to the size the varieties grow. Sow Mustard and Cress, and blanch Endive and Chicory Dandelion, &c.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

NEWSPAPERS.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

SATURDAY, FEB. 25—Royal Botanic Society.

SALES.

MONDAY, FEB. 20 { Plants and Shrubs at Protheroe & Morris' Rooms.

TUESDAY, FEB. 21 { Important Sale of Japanese Lilies at Protheroe & Morris' Rooms. Orchids from Messrs. Charlesworth, Shuttleworth & Co. at Protheroe & Morris' Rooms.

WEDNESDAY, FEB. 22 { Japanese Lilies, Begonias, Ferns, Palms, &c., at Protheroe & Morris' Rooms. Roses and other Plants at Stevens' Rooms.

THURSDAY, FEB. 23 { Roses, Carnations, Shrubs, &c., at Protheroe & Morris' Rooms. Orchids, Liliums, &c., at Stevens' Rooms.

FRIDAY, FEB. 24 { Special Sale of Carnations, Picotees, Lily of the Valley, Gladioli, Roses, &c., at Protheroe & Morris' Rooms. Important Sale of Orchids, from Messrs. Sander & Co. of St. Albans, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39°.7.

The Royal Horticultural Society.

AT the annual meeting held on February 14, under the presidency of Sir TREVOR LAWRENCE, the general tone was one of quiet satisfaction. The meeting-room was packed, but not a discordant note was heard. The Fellows present seemed to feel that the Council had done their work well, and that comment was needless. The most important announcement was that the Rev. Mr. WILKS, who for some few years has acted as Honorary Secretary, had now, in accordance with the provisions of the Charter, become a paid officer. We may at once say that no money payment could adequately represent the value of the services rendered by Mr. WILKS hitherto, but if by the payment of an honorarium, the Society can retain the services of their Secretary, fortunate is the Society. This was set forth clearly by Professor FOSTER in his speech, and thoroughly endorsed by the meeting. The only feeling we have in the matter is, that the salary allotted is much too small in proportion to the importance of the services. In referring to the matter of his acceptance of a salaried office, Mr. WILKS made a manly straightforward speech, which commanded the instant goodwill of the hearers. He narrated briefly the state of things when the Society left South Kensington, and decided to revert to its old and proper policy—the promotion of horticulture. He detailed the work which had been done since at Chiswick and elsewhere, admitted the possibility of mistakes, and begged the Fellows when they saw reason to complain to apply directly to him instead of ventilating their grievances in the press. In a peroration, which rose to eloquence, Mr. WILKS pressed on the Fellows present the necessity of using their influence to obtain new Fellows, and this on the high ground of the advancement of horticulture, not on the lower level of substantial advantage to be gained by individuals. At the same time, we may not improperly point out that the subscribers of one guinea now get a great deal more than the value of their guinea. Indeed, if they choose to avail themselves to the full of their privileges, they would, and do, get a largely disproportionate amount for their outlay.

Reverting to the Report, we note with much satisfaction that a great deal has been done at Chiswick in the way of putting the houses in repair. Owing to former financial difficulties, many of these had become ruinously dilapidated. Now, some have been restored, others rebuilt, two are condemned as beyond repair, whilst no less a sum than £386 has been spent on the great vinery which is now in substantial repair. Those who knew Chiswick in the Kensington days, will recognise the great work that has been done in the reorganisation of the gardens, and will look forward hopefully to further progress in this direction.

Another point in which the Society is marching with the times, is in the institution of examinations and scholarships for young gardeners. Practical training is not defective in this country, but hitherto little or nothing has been done to insist on that thorough grounding in principles and their application to practice, which is the only means of securing progress and power of adaptation to new circumstances.

Of the arrangements for the present year we shall speak on another occasion.

FUCHSIAS AS ROOF CLIMBERS.—Our Supplementary Illustration represents a view in the summertime of a Begonia and Fuchsia-house at Messrs. J. VEITCH & SON'S nursery, King's Road, Chelsea, and well exhibits one of the uses to which some robust-growing varieties of the Fuchsia may be put in beautifying even such a plain structure as a nursery greenhouse. The plants in this case were growing in pots, placed on the bench quite close to the sides of the house, and where the stems and shoots of various lengths were trained from the sides towards the middle of the house, meeting over the pathway. The season's growth was most abundantly flowered at the time that we saw the plants, in the middle of July last. Such varieties as Rose of Castille, Eynsford Gem, Beauty of Trowbridge, Rose of Denmark, among those with light-coloured flowers; General Roberts, with blooms 4 inches long; President, Scarcity, and Abdel Kader, among dark-coloured ones are suitable for the purpose. Of species, we might recommend Boliviana rosea, Fulgens, Dominiana, Corymbiflora, Corallina, and Integrifolia. Fuchsias, whether of varieties or species, require in age a good deal of root space; and in small borders and pots, when filled with roots soot-water and other manurial aids to growth should be afforded the plants, and an annual top-dressing in early spring, after excavating from among the upper roots as much of the exhausted soil as possible; whilst those in smallish pots may require to be shifted into larger ones at that season.

LINNEAN SOCIETY.—On the occasion of the meeting on Thursday, February 2, the president, Prof. STEWART, in the chair, Mr. JOHN PERCIVAL was elected, and Mr. WILLIAM WHITWELL was admitted a Fellow of the society. On behalf of Mr. THOMAS SCOTT, the secretary read a report on the Entomostraca from the Gulf of Guinea, collected by Mr. JOHN RATHAY. Mr. H. BERNARD gave an account of two new species of Rhux. An important paper by Mr. ARTHUR LISTER on the "Division of Nuclei in the Mycetozoa," gave rise to an interesting discussion, in which Dr. D. H. SCOTT, Prof. HOWES, and others took part. This was followed by a paper on the "Structural Differentiation of the Protozoan body as studied in Microscopic Sections," by Mr. J. E. MOORE. The meeting adjourned to February 16.

THE ROYAL HORTICULTURAL SOCIETY.—A grand flower show will be held by this Society in the Agricultural Hall, London, from August 29 to September 1 next, when it is intended to make special awards for heating apparatus and appliances that are practically tested in the building. These awards will prove of the greatest value in promoting trade, and the action of the Royal Horticultural Society in insisting that the awards shall alone be for demonstrated and proved merit, should commend itself to our general exhibition authorities.

AWARDS AT THE ROYAL HORTICULTURAL SOCIETY.—The Society has published a list of all the plants certificated by its various committees from 1859 to 1892 inclusive. This useful task has been performed by Mr. JOHN WEATHERS, who has done his work well. The list is not only useful for present reference, but will have much historical value. For instance, on opening the book at p. 17, we came by hazard on the record of the first exhibition of the berried Aucuba, shown by Mr. STANDISH on June 5, 1861. In the case of species, the compiler should have added the name of the author of the species; thus, Aristolochia elegans, though shown by Mr. BULL, was not described nor figured by him; neither was STANDISH responsible for the name Aucuba japonica. We do not find any record of Botanical Certificates, though they are occasionally given, and are decidedly the most appropriate form of recognition for many things which now get less suitable awards. There is, unfortunately, an impression that a Botanical Certificate is awarded to a plant of relatively little horticultural merit, or to one in which "there is no money." The latter point should not receive the slightest official consideration at the Royal Horticultural Society, though so long as most of the members of its committees are traders, it is impossible to prevent individuals from being swayed by such considerations. The Botanical Certificates, if awarded at all, should be given to all newly-introduced plants (if deemed worthy of an award), to newly-raised hybrids, and to all plants of sufficient botanical interest. Perhaps, in view of the difficulties before mentioned, it would be best to substitute the "Award of Merit" for those cases which now obtain a Botanical Certificate. An "Award of Merit" is too comprehensive to give rise to objection, and the "First-class Certificate" could then be reserved for the showy cultivated varieties brought before the meetings. We are glad to see the rules for the naming of Orchids prefixed to the list of Certificated plants, and should be pleased to see them more fully acted on.

JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY.—Parts 2 and 3 of the 15th volume have lately been issued, and, if not quite so important as some of their predecessors, and the papers not of so high an average, they are yet creditable to the Society. The history of the Begonia, which has been unfolded during the lifetime of the present generation, is well summarised by Mr. VEITCH; whilst that of the Fuchsia, which belongs in part to the preceding period, is sketched by Mr. GEORGE FAY in a very interesting way. The Aster paper is also very valuable. Generally speaking, the "Conference papers" are of superior quality to the others, as if more pains were taken in their preparation. Some of the other papers and communications seem suitable for a mutual improvement or amusement society in the country, and as such would render valuable service, and would be useful for the temporary purposes of the "three o'clock meetings," but they are hardly suitable for permanent record in the *Journal*.

"BOTANICAL MAGAZINE."—The plants figured in the February number are:—

Stevensonia grandifolia, t. 7277.—A noble Palm, famous for its beauty, and for some circumstances connected with the disappearance from Kew of one of the three originally introduced plants, and which led to the application of a name which it is desirable now to suppress. It is one of a group of five Palms con-

Fuchsia House at Messrs. James Veitch & Sons' Nursery, Chelsea.

fined exclusively to the Seychelle Islands, and each represented by a single species. The plant flowered for the first time at Kew last autumn. The tree in its mature state is wholly destitute of spines, whereas in the young state the deep orange-red petioles are clothed with black needle-like spines, 1 to 3 inches long, and the young leaves are orange beneath, and mottled with orange-brown spots above. The difference in these respects between the old and young plants is so great, that Mr. Watson observes that it it hardly credible that they form but one species. It is unnecessary to describe the leaves, but it may be stated that the flower-spike is 3 to 6 feet in length, dividing into numerous slender branches, swollen at the base, and densely covered above with yellow flowers, each about a quarter of an inch in diameter. The flowers are monœcious.

Coccocypselum hirsutum, t. 7278.—A trailing plant, long cultivated as a basket-plant at Kew and elsewhere for the sake of its deep violet-coloured berries, which are borne in heads on slender hairy stalks. It is generally known as C. discolor or C. repens. Sir Joseph Hooker clears up the confusion in the nomenclature, and shows that the plant is a native, not of Jamaica, but of Mexico, Central America, and Trinidad.

Mammillaria prismatica, t. 7279.—Sometimes referred to Anhalonium, a section of the genus remarkable for the spineless rhomboid tubercles. It is very like the one recently figured by us under the name of A. fissuratum, but is said to be much larger, with the tubercles less ovate, smooth, not warted and fissured, and the (funnel-shaped, white) perianth is larger and longer. Kew.

Tritonia rosea, t. 7280.—A Gladiolus, or Ixia-like plant, with spikes of pale rose-coloured funnel-shaded flowers, the three lower segments of which are marked by a yellow blotch. At Kew this beautiful plant proves hardy in a south border protected by a wall.

Trichopilia sanguinolenta (*? sanguinea*), t. 7281.—A species introduced to the Royal Horticultural Society by Hartweg from the Andes of Ecuador, where it has never since been found. In the present notice, Sir Joseph Hooker corrects sundry errors into which his predecessors had fallen, and shows that the genus Helcea proposed for its reception is untenable.

The segments of the perianth are olive-yellow, with large brown spots. The lip concrescent with the sides of the column; oblong, two-lobed at the free extremity, crumpled at the edges, white, margined with violet.

"The Orchid Review."—Number 2 of this periodical is an improvement upon Number 1. The history of hybridisation among Orchids is continued, and will form a valuable record. Incidentally it is mentioned that an imported plant of Anguloa media × presented the same characters as those of A. media × raised by Mr. Seden out of A. Clowesii by A. Ruckeri some years ago. The newcomer, which is in the possession of Mr. Measures, is thus shown to be a natural hybrid, of the same parentage as the one produced by Mr. Seden.

Manchester Orchid Show.—We are requested by the secretary of the Royal Botanical Gardens, Manchester (Mr. Bruce Findlay), to publish the following announcement: "The forthcoming great Orchid and Artistic Plant Group Exhibition at Manchester. Schedules for this event will be issued in the course of a few days. A number of special valuable prizes will be given in the shape of Silver Cups, Medals, and money. It is expected that the Orchid display will be the finest ever seen in the country."

National Chrysanthemum Society.—A meeting of the general committee took place at Anderton's Hotel, Fleet Street, on the 13th inst., Mr. R. Ballantine presiding. Among the correspondence was a letter from Mr. John Earland, Wellington, New Zealand, thanking the committee for the Silver-gilt Medal awarded him in September last for his exhibit of frozen Chrysanthemums, and stating that he had raised other new varieties, which he hoped to send to England on some future occasion. The chairman reported that the two cases of frozen blooms the committee were despatching to New Zealand would leave London in a day or two, and it was expected they would be delivered to Mr. Earland about the end of April. A draft report and financial statement of a very favourable character were submitted by the Secretary, and approved for presentation at the annual meeting on Monday next. The Secretary reported the amount contributed to the Special Prize Fund to date amounted to £128 14*s.*, exclusive of a Silver Cup and several Medals. Fifteen new members were elected, and three societies were affiliated, bringing the number up to 100. Hearty votes of thanks were accorded to Mr. R. Ballantine, the Chairman, and to Mr. R. Dean, the Secretary, for their services during the year.

Flowers in Season.—Some very fine blooms of Chinese Primulas reach us from Messrs. J. Veitch & Sons' Royal Exotic Nursery, Chelsea, better than which is rarely seen. The colours are varied, pure, and decided, and include white, light rose, crimson, purplish-crimson, violet, and lavender-blue. A few double forms are noticed in palest pink, crimson, and rose. These are very pretty, and should make admirable bouquet flowers. In substance, the single-flowered varieties exceed the double ones, as they also do in size and symmetry. Messrs. J. Carter & Co., Seed Merchants, High Holborn, W.C., send others, mostly single-flowered varieties, which indicate a very fine strain of Chinese Primula.

Rosa gigantea.—Mr. T. Hanbury, of La Mortola, Italy, remarks, "This interesting plant, alluded to in your last issue, has passed through the winter well in this garden, and is making a vigorous start to cover an Olive tree."

Potato Disease.—We take from the *Annales Agronomiques* for January 25, the following summary of M. Boehm's experiments for many years, relating to the diseases of Potatos:—"1. True wet-rot is caused by obstruction of the lenticels, and consequently is connected with obstructed respiration. The disease itself, following the invasion of the bacteria, is but a secondary phenomenon. When contact with the air is entirely intercepted, butyric fermentation ensues. 2. In the disease itself, properly so-called (in the restricted sense of the word), the tissues of the Potato are killed by the Phytophthora infestans; the alterations which consequently ensue in the tissues of the tubers are variable, and depend upon the intensity of the infection, the size of the Potatos, the temperature and the moisture of the surrounding atmosphere. 3. When conditions are favourable to the development of the "ærobic" bacteria, the Potatos are reduced to the consistency of liquid-manure; when they decay slowly, and oxygen reaches them in sufficient quantity, the cell-walls become corky (dry-rot), and this corkiness spreads inwards from the exterior. 4. Healthy Potatos, when in the ground, are never infected through the corky envelope which covers them; before they can take the infection, insects, wire-worms, or slugs must pierce this envelope. Neither do healthy Potatos stored in a cellar ever become infected by contact with diseased Potatos. 5. When a diseased Potato is used for seed, either no plant at all or else a healthy plant is obtained from it. It is a mistake to suppose that Phytophthora winters in the tubercles, and thus infests the new plant. The winter form of the fungus is quite unknown. 6. At a temperature of zero, C., not only does the Potato-fungus cease to develop, but it dies. Only the tissues that the mycelium has invaded, and which at first appear perfectly healthy, rot, or become corky."

"Les Plantes Potagères et les Culture Maraichère."—This is a little work devoted to setting forth of the best methods of cultivating vegetables in private establishments and in market gardens. It is the work of M. Ernest Berger, the foreman of the "Fleuriste" of Bordeaux. After describing the best sites for a market garden, the author proceeds to detail the necessary operations required to get it into condition, and then describes the method of cultivation appropriate to each plant, taking them in alphabetical order. Woodcuts and an index render the book very serviceable for the class of persons for whom it is intended. MM. J. B. Baillière et fils of Paris, are the publishers.

The Florets of a Chrysanthemum.—We read in the *Jardin* of a gambling transaction analogous to the Missing Word Competition lately occupying the attention of our law courts. According to our contemporary, some "Americans" (we trust they were not horticulturists) at a recent flower show at Chicago instituted a lottery, the prize of which was 250,000 francs (!), to be gained by the person who should, at a first glance, specify the number of florets in the "Prince" Chrysanthemum. A fine specimen was exposed to view, and no fewer than five thousand gamblers defiled in front of it, to estimate the number of its florets. The estimates, we are told, varied from 120 to 6000, whilst the actual number was 512. We repeat this, as our friends would say, *sous reserve*.

The World's Fair at Chicago.—For the convenience of visitors to Chicago during the forthcoming exposition, a mammoth hotel is being erected by the World's Fair Co-operative Bureau. The hotel is in blocks, somewhat after the plan of St. Thomas's Hospital, and will contain over 6000 rooms. These rooms will be let at a uniform rate of a dollar a day to those who pay a nominal registration fee beforehand, and thus secure the right of occupancy at any time during the exposition.

Boletim da Sociedade Broteriana.—The volume for 1892, edited by Prof. Henriques of Coimbra, contains an account in Portuguese of the Botanic Institute of the University, some valuable contributions to the *Flora of Portugal*, by A. X. Pereira Coutinho in Latin, and a catalogue of the flora of the island of St. Thomas (Western Tropical Africa) by Dr. Henriques.

"The Field Club."—The volume of the *Field Club* for 1892 (edited by the Rev. Theodore Wood) contains, as usual, much information and gossip upon natural history subjects, presented in a form which will interest the *dilettante* as well as the scientific reader. The contents are amusing and instructive, not too insignificant to please the student, nor so technical as to alarm the amateur.

Sarracenia flava, Manda's Variety.—Messrs. Pitcher & Manda announce, under the name of Sarracenia Mandaiana, what they suppose to be a natural hybrid between S. flava and S. Drummondi, as indeed it may well be, as it was found growing in company with the two species named, and is intermediate in character. The upper part of the pitcher and the lid have the spotting characteristic of S. Drummondi.

"Dictionnaire Pratique d'Horticulture."—The French edition of what has come to be called Nicholson's *Dictionary* is being issued monthly. Thanks to the proprietors of the *Revue Horticole*, Messrs. Vilmorin and others, a good deal of additional matter, many woodcuts, and other illustrations, are given, so that the French version is something more than a translation. The work is issued in parts, and may be had from M. Octave Doin, 8, Place de l'Odéon; or of Messrs. Vilmorin, Andrieux et Cie., 4, Quai de la Mégisserie.

American Pomological Society. — The annual publication of this Society always causes us to feel very little—so well organised, so practical, so useful is it. On this side we had little or nothing to compare with it till lately, when the Report of the meeting held at Washington, with various articles on subjects connected with pomology, and the discussion that ensued. The work ends with an elaborate catalogue, in which the value of each particular fruit enumerated in each one of the States of the Union is estimated.

A BOTANIST'S PICTURE GALLERY. — The announcement that the pictures of the late Mr. JOSHUA CLARKE, F.L.S., of Saffron Walden, have just come under the hammer at Messrs. CHRISTIE, MANSON & WOODS, King Street, St. James' Square, London, recalls the personality of a very interesting man. He was born at Saffron Walden on April 10, 1805, and died in the same town in February, 1890. He always resided there, according to an obituary notice in the *Journal of Botany*, and, indeed, had been mayor of the place for ten years. Natural history was the great passion of his life, and he was one of the most active promoters of the Saffron Walden Museum. His special branch of study was local botany, which he followed with such enthusiasm and discrimination as to detect two plants quite new to the English flora—Lathyrus tuberculosus (Linn.), and Erucastrum Pollichii (Schimp. et Spenn.), which he first noticed in Essex. He was elected a F.L.S. in 1853, and contributed occasionally to the *Gardeners' Chronicle*. Although, as has been indicated above, natural history was the primary recreation to him, a mere glance at the list of a hundred odd pictures which were sold on Monday last, proves him to have been a man of very considerable artistic taste. The majority of the pictures were, as might have been expected, of a rural interest, many having flowers for their subject. For instance, there were two pictures of T. S. COOPER, each with the inevitable cows, but one painted in 1867 represents Canterbury meadows, with the old gate in the background. This pair realised £255 4*s*. The two HARDY'S, HEYWOOD and J., were represented by several characteristic "doggy" pictures, one of which by the latter, and labelled "Retriever and Spaniels," sold for 145 guineas; Mr. B. W. LEADER'S "A Welsh River Scene," 195 guineas; and Mr. E. J. NEIMANN'S "On the Wye," £189, are first-class examples of these two excellent artists; and the same may be said of Mr. J. B. PYNE'S three canvases, which, however, only realised an aggregate sum of £51 17*s*. 6*d*. Still life is yet further mirrored in the half-dozen rural scenes of Mr. E. M. WIMPERIS, all of which sold remarkably well; W. C. T. DOBSON'S ambitious and happy picture, "Mother and Child,"

> "Thou art thy mother's glass, and she in thee
> Calls back the lovely April of her prime,"

which was exhibited at the Royal Academy in 1878, was also among Mr. JOSHUA CLARKE'S collection, and was bought apparently by a member of the family for 68 guineas. The drawings, of which there were about thirty, do not call for special remark, except to mention that a series of ten were by J. M. YOUNGMAN. There were nearly a dozen catalogued as "Foreign Masters," the most important of which was, perhaps, "Waiting for the Tide," by J. H. L. DE HAAS, 60 guineas; and C. KUHN'S "A Girl of Ransau, Tartary," 7½ guineas, may be mentioned as having appeared at the Salon of 1869. The sale attracted many of the late Mr. CLARKE'S friends, to whom a very pleasant and agreeable, as well as an inexpensive, opportunity of obtaining a memento of the departed friend, was thus opened up.

MR. D. MORRIS.—We regret to learn that Mr. D. MORRIS, the Assistant-Director, Royal Gardens, Kew, finds himself compelled by ill-health to betake himself temporarily to a more equable climate than our own. Mr. MORRIS has started for Teneriffe, where, we trust, his health may soon be re-established. We shall hope to be favoured by him with some notes on the vegetation of the island.

EARL'S COURT EXHIBITION, 1893: GARDENING AND FORESTRY.—We have before us the preliminary prospectus issued by Mr. H. E. MILNER, as Chairman; GEORGE CADELL, Vice-Chairman, of the Forestry Section; HARRY TURNER, Vice-Chairman of the Horticultural Section; and G. A. LOVEDAY, Secretary. Gardening and Forestry are to be the objects of the exhibition, in addition to which there will be the attractions of music and illuminations, as well as numerous "side attractions." Fruit trees will be shown in all the stages of growth, from the planting to the bearing; and deciduous and evergreen trees of every description will be arranged in attractive groupings, with a view to showing their adaptability to various situations, and the effect that is to be gained by artistic disposition. Modern gardens, applicable to both mansion and cottage, country and town, will be duly set out, and there will even be specimens of allotment gardens shown under the best treatment. As last year, a considerable portion of the main building will be set apart as an indoor garden, only that the arrangement will be entirely different, and more in accordance with the special objects of the exhibition. A splendid collection of the woods of the world will be shown, and the various methods of preserving and working them will be practically demonstrated. Flower and fruit shows are to be fortnightly events during the season, and prizes of sufficient value to induce all the best growers to compete will be offered. Arrangements have been entered into with the Government of Bulgaria for sending over experts and machinery showing how the far-famed Otto of Roses is produced, from the plucking of the petals to the final distillation, when it forms the most delicate perfume in the world. There will be from twenty to thirty different groups of gardening and forestry exhibits; including the flora and fauna of the forest; indigenous and exotic trees and shrubs; specimens of hybridisation; samples of bosh timber and ornamental woods; pulps, fibres, barks, resins, and oils; garden pottery and statuary; summer-houses, kiosks, and châlets; sporting trophies; and garden and forest literature. The exhibition will open on May 13, and close about the middle of October.

Classification of Exhibits. Gold, Silver, or Bronze Medals, and Certificates will be awarded in the various Groups.

Group 1.—(*a*) Specimens of new and rare flowering trees and shrubs; (*b*) Forest flora; (*c*) Collection of seeds, cones, &c.; (*d*) Forest fauna and entomology; (*e*) Specimens of damage done to timber and growing wood by insects, &c.

Group 2.— Growing Collection of Trees and Shrubs: (*a*) Deciduous and evergreen, indigenous and exotic, in classes; (*b*) Deciduous and evergreen, indigenous and acclimatised, with special reference to the grouping for effect; (*c*) Undergrowth for coverts, &c.; (*d*) Fruit trees, trained.

Group 3.—(*a*) Garden and forest literature; (*b*) Working plans of Gardens, forests, and plantations; (*c*) Valuations and survey of estates; (*d*) Charts illustrative of the geographical distribution of trees, their adaptability to various soils, their rate of growth, &c.; of the sequence of plants, natural or artificial; (*e*) Specimens of fossil trees.

Group 4.—Hybridisation of Plants: (*a*) Specimens of a hybrid, accompanied by the two parent species or varieties, indicating which of these has furnished the pollen. (*b*) Specimens of a hybrid A × B produced by crossing the two species or varieties A and B—the plant A having furnished the pollen; and specimens of a hybrid B × A produced by the crossing of the same species or varieties A and B—the plant B having furnished the pollen. The plants A and B must accompany the hybrids.

Group 5.—Collection of Timber Specimens and Ornamental Woods, Rough and Polished: (*a*) Indigenous; (*b*) Exotic.

Group 6.—Wood-working Machinery; (*a*) Sawing, planing, moulding, lathes, &c.; (*b*) Implements and tools used in gardening and forestry; (*c*) lawn-mowers, rollers; (*d*) Digging and draining tools, axes, pruning tools, pumps, cutlery; (*e*) Appliances for the transport of timber; and (*f*) The transplanting of trees.

Group 7.—Wood Engraving, with Samples of Wood; special attention being given to the supply of Boxwood (Buxus sempervirens) or its substitutes.

Group 8.—(*a*) Wood used for ordnance and small-arms, backing for armour-plates, lance-stocks, &c.; (*b*) Wheels; (*c*) Sleepers and rolling stock of railways, telegraph-poles, &c.; (*d*) Paving or street purposes; (*e*) Mining timber; (*f*) Bent timber.

Group 9.—(*a*) Woods used for parquetry, with examples; (*b*) Mosaic; (*c*) Wood-block flooring; (*d*) Ceilings, wainscoting, and internal wall decorations; (*e*) Household furniture.

Group 10.—(*a*) Fibres; (*b*) Wood-pulp materials used for paper-making; (*c*) Ropes, lines, and twines; (*d*) Resins and oils; (*e*) Dyes and stains; (*f*) Barks; (*g*) Spires.

Group 11.—(*a*) Wood-carving; (*b*) Turnery; (*c*) Decorative painting on wood.

Group 12.—Processes for the preservation of timber: (*a*) To resist wet and dry-rot; (*b*) To resist fire; (*c*) Paints and other wood-preserving compositions.

Group 13.—Fertilisers and Artificial Manures.

Group 14.—(*a*) Garden pottery; (*b*) Statuary vases; (*c*) Edgings, &c.

Group 15.—Miscellaneous accessory Decorations to a Garden.

Group 16.—(*a*) Fancy woodwork; (*b*) Baskets; (*c*) Bamboo canes, Willows, &c.

Group 17.—(*a*) Plant-houses; (*b*) Show and growing-houses; (*c*) Systems of glazing; (*d*) Heating.

Group 18.—(*a*) Fencing; (*b*) Gates; (*c*) Tree-guards.

Group 19.—(*a*) Summer-houses; (*b*) Châlets, kiosks; (*c*) Garden-seats; (*d*) Flower-stands; (*e*) Boats, canoes, &c.

Group 20.—Distillation and Preparation of Scents, and Flowers and Woods used.

Group 21.—(*a*) Settlements in new countries, showing camps and camping contrivances; (*b*) Cultivation of Tea, Coffee, Opium, Cinchona.

Group 22.—(*a*) Sporting trophies; (*b*) Pictures of forest trees.

Group 23.—Any Exhibit not particularised in the above Groups, in furtherance of the objects of the Exhibition, will be admitted.

THE DEVON AND EXETER GARDENERS' ASSOCIATION.—At the last meeting of this Association, an excellent paper was read by Mr. W. SWAN, gardener at Bystock, on "Orchids," a fine display of Orchid blooms being provided by him to illustrate the same.

THE BIRMINGHAM AND DISTRICT AMATEUR GARDENERS' ASSOCIATION has just been formed for the purpose of having lectures, papers, discussions, and exhibitions, and to encourage gardening amongst working-men and those who have only small gardens, and although there are no great restrictions as to membership, there are as to becoming exhibitors, as none who employ professional help, excepting in digging or rough work, or who is professionally engaged in the nursery, seed, or florist trade, will be allowed to compete for prizes. Judging from the rapid increase of members, the society promises to be a large one, and is capable of influencing gardening amongst the operatives and others of a large town like Birmingham.

BIRMINGHAM GARDENERS' ASSOCIATION.—The members of the above, their wives, and lady friends, met under the chairmanship of Mr. B. W. LATHAM, at one of the principal hotels of Birmingham, on the eve of the 8th inst., to the number of 100, when a musical concert was given.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—As an instance of what local societies are able to do in aiding the gardening charities, we are asked to mention that the Reigate and District Chrysanthemum Society has remitted to the Gardeners' Royal Benevolent Institution no less a sum than £136 10*s*. during the four years that it has been established, and has thus been the means of nominating thirteen of its members as life-members of the institution. Mr. JAMES BROWN, the indefatigable honorary secretary of the Reigate society, expresses a hope that kindred societies, if able, may be induced to do likewise, and thus not only add to the funds of an excellent charity, but also benefit their own members by conferring upon them, as funds permit, the privileges of life membership of the institution.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The monthly meeting of the above was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last. The chair was taken at 8 o'clock by Mr. W. P. THOMSON. Seven new members were elected, and one other nominated. Two members only are on the sick fund. The annual meeting will take place at the above hotel on Monday evening, March 13, at 8 o'clock. Mr. ARTHUR VEITCH has kindly consented to preside.

GARDENERS' ORPHAN FUND DINNER.—The secretary of the fund desires us to inform our readers that Baron FERDINAND DE ROTHSCHILD, M.P., has kindly consented to preside at the annual dinner, to be held on Wednesday, March 22, at St. James's Hall, Regent Street.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, February 20, when a paper will be read by Mr. G. M. FREEMAN (Associate), entitled "The Arbitration Act, 1889." The chair to be taken at 8 o'clock.

RAILWAY RATES.—A deputation of over a hundred Members of Parliament waited on Mr. MUNDELLA, the President of the Board of Trade, on

February 15, with reference to the grievance inflicted on traders (especially on agriculturists and gardeners) by the recent action of the railway companies. The deputation met with a very sympathetic reception, and an announcement that, if before Easter the railway companies did not amend their ways, steps would be taken to compel them to do so.

THE HORTICULTURAL CLUB. — The annual dinner was held on Tuesday last at the Club Rooms, Hotel Windsor. Sir JOHN LLEWELYN, Bart., was in the chair, and a larger number of members were present than ever before. The Chairman expatiated on the advantages the Club offered to those whom business or pleasure attracted to horticultural pursuits. The musical arrangements were under the kind direction of Mr. GEO. BUNYARD. Several new members were elected.

WAHLENBERGIA PUMILIORUM, *Garden*, January 28.

AMERICAN AND BRITISH APPLES.

I AM puzzled to account for the prices quoted by Mr. Evans in your issue of February 4, and the adjustment of which will no doubt be a good answer to his puzzle.

Blenheim Orange (good colour), at 5*s.* 6*d.*, and Cox's Orange Pippins, at 6*s.* per bushel, may safely be considered the lowest prices of the season; of course, I do not refer to smalls or seconds.

Of Americans, up to Christmas, the highest price obtained for some very fine Golden Russets was 14*s.* per barrel, actually less than 5*s.* per bushel, and the average price of Canadian and American varieties up to that date would not exceed 10*s.* per barrel. Newtown Pippins, "small size, spotted, and inferior quality," 10*s.* and 11*s.* and not 40*s.* Surely Mr. Evans must know that more than a "few years" are required for a new Orchard of Blenheim or Cox's Pippin to come into bearing in such quantities as would be sufficient to knock out the American and other foreign yearly supply of nearly 2,000,000 barrels, representing the crop of more than 40,000 acres of matured orchards.

During the last ten years, the increase of acreage under orchards has been 25,000 acres, which is not more than sufficient to keep pace with the increasing demand, and nothing in lieu of orchards valueless from age and producing only cider fruit. The 180,000 acres in bearing ten years ago are now getting (a large proportion) very old, and turning out, probably, mostly small and spotted fruit, besides suffering an occasional total failure of crop. To depend on such orchards for the supplies demanded by our great centres of population, would be to greatly disappoint the public, whose taste has been educated up to an abundance of fine fruit from young orchards. It is nonsense to say the public "hanker after that which is grown abroad;" they demand a continuous supply of what they well know to be good, and which in the past has not been obtainable from English growers.

An English orchard in bearing, say fifteen years ago, may well be compared to "an old woman's nicey shop, where a hap'orth of all sorts" could be obtained.

A plantation in the old days was made with the idea entirely of supplying local wants; to follow which on the same lines now would render progress impossible. The fact is, growers seem to be too slow to grasp what our present requirements mean, or they lack the capital; or having the capital, lack the courage to put it into land where they are not secured.

To recommend all new plantations to be of early kinds, and to be sold (or rot) before foreign importations started, would really assist the foreigners to continue to hold our trade, which they are masters of at this moment.

At present, the southern counties of England are specially well placed for competing with the American and Canadian supplies. First, the situation is generally well adapted for the growth of fruit trees, and good cropping of the same; secondly, the Americans and Canadians (the latter to a less degree) have both passed their best days for producing handsome fruit, the effect, no doubt, of aged orchards; thirdly, the cost of freight and carriage to a London market equals 1*s.* 6*d.* per bushel. This cost alone is an advantage in favour of the southern home-grower of at least 1*s.* per bushel, sufficient to cover interest on all outlay in planting. [How about the new railway rates? ED.] If the English growers would only study the tastes of the masses, who consume the bulk of this fruit, some headway would soon be made. We should have very large supplies of large, handsome fruit, selected prime eating, from prime cooking Apples—not mixed, as is too often the case; in fact, until suitable fruit in sufficient quantity is produced at home, the foreigner is bound to hold the trade, the vastness of which can only be realised by a few. A total of one day's sale at port of arrival is often above 30,000 barrels, which is equal to the produce of 500 or 600 acres. And where, pray, is the fear of Tasmanian, New Zealand, or Australian competition? Every bushel of Apples sent from those colonies will cost 8*s.* or more money to put on to our markets.

I note that Sir W. Hart Dyke intends to introduce a Bill for the "Better Regulation and Sale of Foreign Fruits." Except a common complaint among home growers of free importation of foreign fruit and vegetables, never a murmur have I heard, and I question if he can do anything beyond increasing costs, and causing delays in handling the produce, costs in addition to losses through delay, and this, too, without a possible benefit to individuals or the government, or a return for the outlay. If additional costs must be incurred by consignors, why not tax fruit right out, and recoup the Treasury for cost in looking after the entries, which, as many consider, should bear its share of custom-house expenses.

The dealers, wholesale and retail, are equally alive to the kinds of fruit, and whence they come, that are offered by the fruit brokers, but the public, if it be supplied with handsome sound fruit at comparatively low prices, care little where it was grown; and, further, in nine cases out of ten, the foreign fruit offered cannot be produced by English growers at the same time, and in many instances the retailers are most particular in naming the country whence it came, to obtain which facts they often pay a higher price. At the present moment may be seen in Covent Garden English produce packed in foreign packages, with what object I leave those who peruse these lines to judge.

If Sir W. Hart Dyke desires to aid the home growers, a Bill to secure a tenant's invested capital for outlay on land, would do more good than a dozen Bills to regulate sales of imported fruit. *J. B. Thomas, Covent Garden, February* 9, 1893.

FRUIT NOTES.

APPLE HORMEAD PEARMAIN.—This variety does not appear to be widely grown, or, at any rate, to be generally known under its correct name. I observe that it is catalogued by Messrs. Jas. Veitch & Sons who speak highly of it. It is deservedly very popular in this locality, where it is known by the name of Long Pippin, and large trees of it may be found in most of the old orchards on this estate. The greater number of these trees have apparently not been touched by the knife, saw, or hatchet, since they were planted, and yet they seldom fail to bear a good crop of fruit, rivalling by their constancy even the King of the Pippins. The trees are invariably free from canker, and their fruit from mildew and Cladosporium, even in orchards where these parasitic fungi give trouble. I have no experience with it as a pyramid on the Paradise stock, but as a standard upon the Crab it can be highly recommended for planting on heavy clayey loam soils, particularly where the subsoil is a calcareous marl. It is described by Mr. Barron in the *Journal of the Royal Horticultural Society*, vol. x., thus:—"C. (culinary), large, conical, even, greenish-yellow, russetty, brisk flavour, mid-season, first quality; a very handsome Apple." It is in season from October to the end of February, but most briskly-flavoured in December, and it cooks perfectly. Is this Apple synonymous with Horner's Pearmain, which Mr. Cheal recommended at the Conference held at Chiswick in 1888 as one of twenty-four kinds selected for pyramid and bush culture upon heavy soils? *Thos. Coomber, Hendre Gardens.*

PEAR JOSEPHINE DE MALINES.—As a late Pear this is one of the best-flavoured at this part of the winter, and, unlike that other first-class late variety, Winter Nelis, it succeeds equally well when grown as pyramid, bush, or trained tree on a wall. There is one thing that must be observed, and that is to let the fruit hang on the trees as long as possible, even going to the trouble of covering the trees with a fish-net to save the fruit from injury by birds. The foliage is distinct from other varieties of the Pear, which, being small and narrow, and the growth of the tree is weak and irregular, which, in my opinion, is an advantage, as the fruit is greatly benefited by the fuller amount of sunshine which this enables it to enjoy. *R. Milner, Penrice Castle Gardens.*

THE GHENT QUINQUENNIAL.

MANY of our readers are familiar with the Casino at Ghent, the numerous and spacious rooms of which are utilised by the Société Royale d'Agriculture et de Botanique for the purposes of their exhibitions, and of which we give a view from the exterior (fig. 30). Spacious as they are, it is necessary on the occasion of the International Exhibitions every five years to erect supplementary structures, and we are now enabled to place before our readers a view of the principal façade of the annexe now in course of construction by MM. Morial and Tertzweil (fig. 31). This building is 10 mètres in height, 80 mètres in length, and of a width varying from 20 to 40 mètres, the entire space covered being 2625 mètres. Provision has been made for heating the building in case of need. As we have before mentioned, the exhibition opens on April 16, and the jury consists of experts chosen from all nationalities, but with the exception that no resident in Ghent itself can undertake the office. The jury will have plenty to do, for there are no fewer than 660 classes, with three or more prizes in each. The Queen's Medal will be awarded for the best collection of twenty-five stove plants in flower; the Medal offered by the King is to be awarded for the most varied and meritorious collection of Orchids. Other special prizes are offered by the President, Count de Kerchove de Denterghem, Baron Henri de Ranst de Berghem, M. de la Devansaye, MM. De Smet, M. Seidel, M. Benary, the English Van Houtte Committee, and the trustees of the Veitch Memorial. In addition, the Society offers twenty-one "Objets d'Art," six Gold Medals each of the value of 200 francs, twenty-two of 150 francs, ninety of 100 francs, 121 of 50 francs, and 1234 Medals of silver-gilt and silver. Exhibitors from all nations are invited to compete. We are informed that several of our British nurserymen will

enter the lists, so that we anticipate a magnificent and varied show, whilst the hospitality of the Belgians is proverbial, and has but one fault—it errs on the "too much of it" side.

HOME CORRESPONDENCE.

THE ORPHAN FUND ELECTION.—With most of the remarks on p. 175, I cordially agree, but if "only very considerable exertions on the part of candidates' friends will win elections" in the future, I think that we are fast drifting in the wrong direction, and the result will be that the candidates whose friends are the wealthiest will be elected, and those who are worse off, and therefore most in need of assistance, will fail to obtain any or but few. Personally, I object to any canvassing for votes whatever, and have done so from the commencement; it is also quite unnecessary so to do, as a full list of the candidates with all particulars is sent from the office to each subscriber with the voting paper. There are at a rough calculation about 1200 subscribers, if only half of these are applied to by post-cards, it is putting far too much expense on people who cannot afford it, and many of whom are—it is sad to say—only just able to keep themselves and families alive; on the other hand, I suppose the majority of the subscribers appreciate the privilege of voting, and it would not be possible to manage the election on any other system, and to give satisfaction to the supporters of the fund at the same time. The new source of income recommended would probably amount to very much less than "A. D." imagines; at any rate it would not make a "magnificent" addition to the funds. *W. H. Divers, Ketton Hall Gardens, Stamford.*

RAILWAY RATES.—The attempt on the part of the Board of Trade to regulate these has, apparently, largely failed. The "Railway and Canal Traffic Act" was one from which much was hoped; but some of us feel that the decision in the case of the "Liverpool Corn Traders' Association *v.* Great Western Railway Co.," confirmed on appeal, has "knocked the heart out of it." This judgment appears to go entirely contrary to the intention of the law. My special object in writing is to suggest that if all interested in the cultivation of the soil would combine, it ought to be possible to get a law enacted, making it illegal to carry goods at a lower rate for long distances than for short ones. In several of the United States it has been made illegal for a railway company to carry foreign grain, for instance, past a farmer's door at a lower mileage rate than would be charged the farmer for the conveyance of his own produce. *J. Marshall Sturge, Bullesford Gardens, Bewdley.*

JAPANESE IRISES.—The article on, and illustration of, the Japanese Irises in *Gard. Chron.* of Feb. 11, ought to lead to their more extensive cultivation by amateurs. I have long wondered that owners of gardens on damp soils have not planted them on a considerable scale, as the cultivation of the plants is very simple; they appear to be quite hardy, and all that they seem to require is fairly good soil and damp situations. I have grown them for many years at Oakwood in quantity round the ponds, where they have formed one of the principal midsummer ornaments to the garden. Last year, having occasion to take a damp field into the garden, I partially drained it by means of a wide ditch, on the banks of which were planted seedling Rhododendrons, and on the sloping sides, down to the water's edge, about 700 clumps of seedling Japanese Irises; and the field itself, proving wetter than was expected, was planted with between 3000 and 4000 more clumps of the seedling Irises, and according to present appearance there is every probability of my being able, about the end of June, to send you a photograph much in the style of your picture. It was very comfortable to call the comparatively narrow petalled white form Iris lævigata, and to believe it to be the type, and the broader petalled bright-coloured form, Iris Kæmpferi, but I suppose this must now be given up. One great merit of this Iris, from the amateur's point of view, is that its cultivation is inexpensive; the plants seed freely, and seedlings of very many shades of colour bloom in the third year. All our plants were raised from a few imported plants bought long ago. *George F. Wilson.*

TREATMENT OF GOLD FISH.— Will Mr. Chas. T. Druery be kind enough to explain how the confervoid growth would be removed from the well-washed gravel, he mentions in his note in your issue of the 11th? I find that if gravel is placed in the water it very quickly becomes covered with confervoid growth; am I to infer from his article that the gravel is frequently taken out and washed? *M. E. Mills.*

TUFTED PANSIES.—I am very pleased to see your protest against the misleading appellation of Tufted Pansies as applied to Violas; and I have written and protested against it since its introduction. Your remarks, condemnatory of the term, will I trust lead to its obliteration, and that Viola will remain as significant of the smaller-flowered section, in contradistinction to the larger-flowered Pansy. Of course, everybody knows that the Pansy is a Viola tricolor, with its hundreds of varieties, and that we are indebted to Violas cornuta and lutea chiefly for our modern bedding Violas, but these are getting greatly mixed up with the Pansy breed, and an accurate classification of Violas under the heading of Violas and bedding Pansies is almost necessary, but very difficult to do, as some of the cross-breds have the Pansy flower with the Viola foliage and growth. I have at various times been asked to classify them, but knowing how difficult it is to do so correctly, I have declined with thanks. With me, they are classified as Bedding Violas and Pansies; and our splendid race of Pansies as Exhibition, Fancy, and Show varieties, the latter, a very old term used by old florists. *W. Dean.*

ARUM PALÆSTINUM.—I brought three bulbs with me from Jacob's Well, Palestine, six years ago. They have bloomed every year. Two splendid flowers are now nearly gone; three more blooms will be out in a short time, and others later. I have given bulbs to three friends, all of which have bloomed. They increase very rapidly, but the flowers, although as large or larger, are more elongated, and I find require support. The plants also grow taller. The stems of the flowers are a rich dark colour; they have rather the smell of an Apple-room. We constantly passed them in bloom in March and April in riding through the fields. This particular kind is peculiar to Palestine. *C. E., Hawkhurst.*

VINE-DRESSING AND PETROLEUM.—Observing that some of your correspondents are detailing their experience with regard to petroleum dressings on Vines, &c., I desire to give mine. In the first place, I have always understood petroleum to be dangerous if applied carelessly. Nearly twenty years ago I was told that it was a good kind of insecticide if used at the rate of one ordinary wine-glassful to one pailful, or about three gallons of water, and in that diluted state I have washed many kinds of plants and fruit trees, and have never observed any ill-effects when this proportion of petroleum to water was adhered to. In our vineries, Peach-houses, and Fig-house, as soon as the crops are cleared, the trees are invariably washed several times by means of the garden-engine. I should not think of using petroleum as a winter dressing unless mealy-bug was present, and then I prefer to use Fir-tree oil, as being much more effective than the former; neither would I make use of petroleum against red-spider. As a general rule, the washings are afforded at the strength I have described when the foliage is still on the Vines, and are sufficient to destroy red-spider and thrips. *W. A. C.*

THE BARBAROSSA GRAPE.—In reference to the origin of this Grape, as alluded to by Mr. Leach on p. 174, perhaps the following statements may prove interesting. It is correct that the late Mr. John Butcher secured and worked up for sale the original stock of it in this country, and over forty years ago, as I have a perfect recollection of my late father having a young Vine of Mr. Butcher about that time, and with what interest we watched its progress and fruiting. Mr. Butcher was not the original intro-

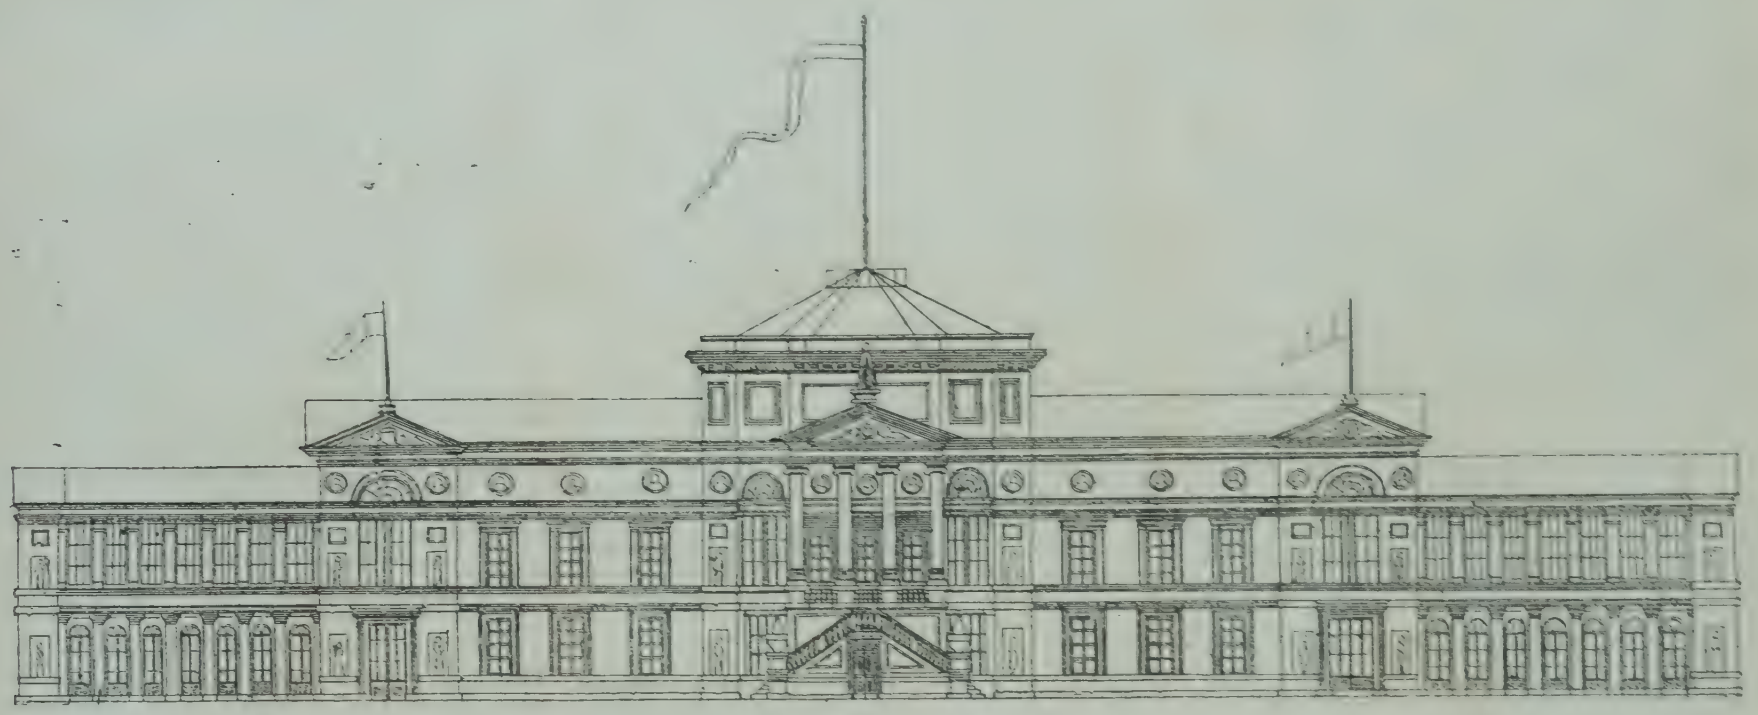

FIG. 30.—PRINCIPAL FRONT OF THE EXHIBITION BUILDINGS OF THE ROYAL AGRICULTURAL AND BOTANIC SOCIETY OF GHENT. (SEE P. 203.)

ducer of it into this country, but procured his stock of cuttings from Clopton House Gardens, about 1 mile distant from Stratford-on-Avon, the residence of the late Mr. Ward (the owner), now the property of Sir Arthur Hodgson, and who brought it from Turkey, where it was said to be much esteemed. In Dr. Hogg's *Fruit Manual* it is remarked that "Gallesius says it is the king of dessert Grapes.") Mr. Ward was very fond of it, and had a whole house of it established several years before Mr. Butcher propagated the variety, as also was his clever old gardener, the late Mr. Bevington, and whom I, as a youth, well recollect once having watched when thinning some fine bunches of this Grape, with much interest, as the pair of scissors—or, rather say, small shears—similar to a pair of sheep-shears, and which I much coveted, as I found upon trial that the operation could be much more expeditiously effected than by the ordinary scissors, owing to the spring in them—they were specially made for the purpose. Regarding the colour of the fruit of the Vines in question, it was always perfectly black, unless indifferently grown and ripened, and the appellation Gros Guillaume used to be considered merely as a subsequent synonym. According to the *Fruit Manual*, the true Barbarossa is not in this country, though one very similar to it is occasionally met with, called Gromier du Cantal, and that the name Barbarossa was given to the Gros Guillaume Grape erroneously. The *Manual's* description of the latter strongly favours this statement, as far as my own experience goes. Mr. Butcher used to send purchasers of the Grape in question over to Clopton to look at the well-coloured crop of fruit. *W. Gardener, Harborne, Birmingham.*

CAUSE OF GOOD FLAVOUR IN GROS COLMAR.—Although no other causes except those I gave have been given up to now, I am glad that I called forth Mr. Castle's very practical letter. One of the chief requisites for good flavour is large-sized berries, and this is got, as Mr. Castle says, by inarching on the Muscat of Alexandria. Mr. William Thomson's and Mr. Spence's Gros Colmar were perfectly finished, and had the "sloe-black" colour. The conservatism of gardeners is shown by the great number of growers who will not have anything to do with Gros Colmar, but still stick to Lady Downe's Seedling. At Hillwood, near Edinburgh, there is a long span-roofed house devoted to Lady Downe's. I never saw Lady Downe's so large-berried as it was here, consequently the berries were much juicier than usual, and the thickness of skin scarcely noticeable. In the same house was an oblong-berried pink Grape, of exquisite flavour, quite distinct from any other Grape. This Grape reminded me of an amusing anecdote. A well-known Scotch gardener (it is a moot point whether he is better as a curler or as a gardener), when he came to his first place in Scotland, found the Black Hamburgh Grapes pink in colour. He lifted the roots and remade the border. He, however, got no thanks at first, for her ladyship said, "What has become of my beautiful pink Grapes? they were so nice," and could hardly be persuaded that they were the same Vines. *Vagabond.*

—— In reply to "Vagabond," I am happy to give my experience as to the effect of inarching these varieties. I find that Gros Colmar on Muscat of Alexandria stock, grown in an inside border, or in pots, succeeds better than on its own roots. The leaves do not curl so much, they suffer less from scorching, and they keep a fine dark green until the Grapes are fully ripe. The sap is therefore perfectly elaborated, and the Grapes are consequently very sweet, and free from the Ivy-leaf flavour so peculiar to the variety when imperfectly ripened or badly grown. There is, however, no Muscat flavour perceptible, but the bunches are rather more tapering than is usual with Gros Colmar. The berries take a fine deep colour and perfect bloom, even where the sun shines directly upon the bunches, but perhaps the best test is that my Grapes thus grown, realise a higher price than Gros Colmars grown on own roots. It is highly interesting to observe that the Gros Colmar branch increases in thickness at a much greater rate than the stem and branches of the Muscat stock, which, it is evidently starving, as the Muscat Grapes upon the inarched Vine are much inferior to those produced upon the other Vines in the same house. The poor flavour of ordinary market Gros Colmar Grapes is due to crowded vineries, insufficient light and ventilation, and the too abundant use of cow and horse manure, with their scalding ammoniacal exhalations. I have discarded these for inside borders, and use only Thomson's Vine Manure, ashes from rubbish-heap, bone-meal, siftings from old mortar and brick-rubbish, and fibrous yellow loam. I am thus able to keep the borders clean and open to the sun, so as to receive and reflect its beams through the atmosphere of the vinery. Gros Colmar requires sun-heat as well as fire-heat, and a long time to ripen. *W. R., Streatham Hill.*

Fig. 31.—Ghent Quinquennial: façade of annexe to the exhibition buildings. (see p. 203.)

SOCIETIES.

ROYAL HORTICULTURAL.

February 14.—Rarely have we seen a better display during the winter months than that brought together at the Drill Hall, James Street, Westminster, on this occasion, which may be attributed to the mildness of the weather, and also to the increased interest taken in these gatherings, and to the occurrence of the annual meeting on the same day. This latter meeting is commented on at p. 200. Orchids were numerous, and included some promising hybrids, in several genera, whilst some groups of plants from nurserymen and amateurs attracted considerable attention. Fruit in quantity was staged by the trade as well as by several amateurs, the collection of Oranges exhibited by Messrs. Rivers, being especially noteworthy.

Floral Committee.

Present: W. Marshall, Esq. (in the chair), Messrs. H. Herbst, Owen Thomas, G. Stevens, C. T. Druery, W. Furze, J. Jennings, H. H. D'Ombrain, C. J. Salter, P. Barr, C. Noble, H. Turner, J. Fraser, G. Gordon, C. E. Shea, J. D. Pawle, G. Paul, W. H. Williams, R. Owen, F. Ross, C. Jefferies, W. Bain, T. Baines, H. B. May, G. Nicholson, and E. Mawley.

A pretty group of New Holland plants were from Messrs. Hugh Low & Co., Clapton, and included Eriostemons, Ericas, Genistas, the beautiful Pimelea spectabilis, Acacia Drummondi, A. armata, A. cordata, Chorozema Lowii (as free-flowering as ever), Correa cardinalis and C. magnifica, Diosma capitata, and the ever sweet-scented Boronia megastigma (Silver Banksian Medal).

Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esher, was awarded a Silver-gilt Flora Medal for a pretty and creditable group of miscellaneous plants in which were Phaius grandifolius, Cœlogyne cristata (well-flowered but not a specially good variety), Calanthe vestita lutea oculata, Cypripedium insigne, Thyrsacanthus rutilans, Calla æthiopica, Ferns, &c.

A group of Cœlogyne cristata, including the varieties C. c. maxima, C. c. Lemoniana, and the Chatsworth, was from Messrs. Paul & Son, Cheshunt. Also some forced plants of Lilac, including L. alba grandiflora, Marie Lesgrange, Matthien Dombasle (mauve double), and Madame Abel Chatenay (double white). This group, which included some plants of Lachenalia aurea, L. luteola, and the fine hybrid L. Nelsoni, was awarded a Silver Flora Medal.

From the gardens of the Hon. P. C. Glynn, Rook's Nest, Godstone (gr., Mr. J. Friend), came a collection of Camellia blooms, amongst which were some nice ones of Camellia fimbriata; a magnificent branch of Acacia dealbata, covered with bloom, came from this garden (Bronze Flora Medal).

Messrs. E. D. Shuttleworth & Co., Peckham Rye, and Fleet, Hants, brought a group of foliage and flowering plants, including Dracæna Lindeni, Crotons, Palms, Lily of the Valley, some Azalea mollis, &c.; also some blooms of Narcissus, which had been forced in pots, amongst which were N. Countess of Annesley, poeticus, and p. ornatus, Ard Righ, Emperor, Henry Irving, Telamonius flore-pleno, albicans, &c., (Bronze Flora Medal). A group of Cyclamens in variety, well-flowered, and of good strain, were from Messrs. Charles Turner & Co., Royal Nurseries, Slough (Bronze Flora Medal).

Mr. W. H. Perkins, gr. to Viscountess Ham-

bledon, Greenlands, Henley-on-Thames, sent eight plants of Amaryllis, in as many varieties, new and of much merit. The Committee gave an Award of Merit to a very handsome dark crimson variety called the Hon. W. H. D. Smith, which had thrown two very strong spikes of bloom. The Hon. Mrs. W. Codrington is but little inferior, and of similar colour, though not quite so deep. A good variety, belonging to the mottled or flaked section, is Viscountess Hambledon, and the Hon. Miss Smith had good blooms, with the inside base of greenish-white, and the upper part of petals coloured brick-red—somewhat singular-looking.

Messrs. W. Cutbush & Son, Highgate, London, N., had a group of Dracænas, including D. superba, D. elegantissima, D. Bella, D. Mrs. Freake (a narrow-leaved variegated plant), and D. angustifolia; also a group of well-grown plants of Erica Wilmoreana (Vote of Thanks).

Messrs. Robert Veitch & Sons, Exeter, sent a plant of Asparagus retrofractus arboreus, and two plants of Arum palæstinum, which was figured in our columns on January 28 last.

Messrs. Garaway & Co., Clifton Nurseries, near Bristol, sent a few plants of Primula, Garaway's White Perfection.

Chrysanthemums still linger with us, and Mr. Robert Owen, Maidenhead Nursery, obtained an Award of Merit for a large Japanese Beauty of Castle Hill. The petals are narrow, and the centre (which is not particularly good, as shown) is of light chestnut, falling still paler towards the circumference. Another one from Maidenhead was New Year's Gift, Japanese, white, with pale lemon centre.

Mr. S. Mortimer, Swiss Nursery, Rowledge, Farnham, showed a group of cut blooms of Chrysanthemum Golden Gem (Vote of Thanks).

Orchid Committee.

Present: Dr. Maxwell T. Masters, F.R.S., in the chair; and Messrs. J. O'Brien (Secretary), Sydney Courtauld, E. Moon, J. Douglas, F. Sander, Rev. E. Handley, C. Pilcher, E. Hill, H. Low, H. M. Pollett, W. H. White, T. W. Bond, T. Statter, T. B. Haywood, G. R. Le Doux, and H. Williams.

A very fine show of Orchids was got together, and a great number of exhibits were submitted to the scrutiny of the committee.

Sir Trevor Lawrence, Bart., Burford, Dorking (grower, Mr. W. H. White), sent a fine hybrid Cypripedium concolor × Lawrenceanum, with flowers somewhat resembling those of C. Marshallianum, the whole flower creamy-white, tinged with rose. The foliage is marbled dark green and ivory-white (Award of Merit). From the same gardens also came a curious slender Maxillaria and Masdevallia Schroderiana.

Messrs. Jas. Veitch & Son sent a fine new Hybrid Phaius, P. amabilis (grandifolius ♀, tuberculosus ♂). It had much of the beauty and the dwarf stature of P. tuberculosus. Sepals and petals white, tinged with rose on the face; lip ample and crimped, claret-coloured, with darker lines on the whitish lens, which is yellow on the outside (First-class Certificate). Messrs. Veitch also exhibited Cypripedium Winnianum × (villosum × Druryi), which was given an Award of Merit; and their charming violet-tinted Epidendrum Endresio-Wallisii (Wallisii ♀, Endresii ♂), which had previously received a First-class Certificate.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, had an extensive and showy group of fine Orchids, remarkable among them being grand specimens of some three dozen species and varieties of Cypripediums. Some of the more striking were C. Morganiæ, C. Dauthierii striatum ×, C. Sallierii aureum ×, C. nitens superbum ×, C. Amesianum ×, and their noble C. Pitcherianum ×, Williams' var. Other fine things were Cattleya Trianæ alba, a fine form of Odontoglossum blandum aspersum, some good Lycaste Skinneri, Ada aurantiaca, &c. (Silver Flora Medal).

Messrs. F. Sander & Co., St. Albans, had a select group of new and rare Orchids, the most striking of which was a fine pan of Dendrobium Owenianum × (Linawianum majus × Wardianum), a grand hybrid, of noble flower and free habit. The flowers, which are borne in bunches on long foot-stalks, are nearly 4 inches across, all the segments broad and flat. The sepals and petals are white, heavily tipped with rosy-crimson; lip with reddish-brown marking on a yellow disc at the base; the remaining portion white, tipped with rosy-crimson, like the other segments. It was raised by Norman C. Cookson, Esq. (First-class Certificate). Another good hybrid was the dwarf Lælia Maynardii × (pumila Dayana × dolosa), which had the sepals and petals marked with bright rose colour, the crimped labellum dark reddish-purple (Award of Merit). Other fine things in Messrs. Sander's group were Dendrobium Sanderæ (nobile albiflorum × heterocarpum); the handsome Dendrobium nobile Amesiæ, white with purple eye (Award of Merit); the pretty pale pink-coloured D. nobile Ballianum; the true Lælia anceps Schroderiana, Phalænopsis Sanderiana, Lycaste Skinneri alba, L. S. rosea, L. S. picturata, and L. S. leucoglossa, all very handsome forms (Silver Flora Medal).

Messrs. Hugh Low & Co., Clapton Nurseries, had a fine group, consisting chiefly of Phalænopsis; among which was the remarkable pure white P. Schilleriana vestalis (First-class Certificate).

There were also some well-bloomed plants of Saccolabium bigibbum and other things (Silver Flora Medal).

Messrs. Pitcher & Manda, the United States Nurseries, Hextable, Swanley, had a group, consisting of a number of species and varieties of Cypripediums; their C. Wallaertianum pallidum × being very distinct; also the varieties of C. Godseffianum ×, C. Boxallii, C. Juno ×, and C. gemmiferum were very fine (Silver Banksian Medal).

Messrs. F. Ross & Co., nurserymen, Merstham, exhibited Cymbidium grandiflorum (Griffith) (Hookerianum), a very fine form of that which was illustrated in *Gardeners' Chronicle*, February 27, 1892, p. 267, from another plant shown by the same firm. It is a noble plant, and the facility with which Messrs. Ross flower it does away with the imputation that it is a shy bloomer (First-class Certificate).

Mr. Wm. Whiteley, Hillingdon Nurseries, Uxbridge (manager, Mr. G. Bethell), sent the very beautiful and perfectly formed Cattleya Trianæ, Hillingdon variety all the floral segments of which are broad, the petals and lip beautifully crimped, the front of the lip is very large and rounded, and of a rich claret-crimson colour (Award of Merit).

C. J. Lucas, Esq., Warnham Court, Horsham (gr. Mr. Duncan), sent Angræcum hyaloides, A. polystachyum, and cut flowers of several good forms of Cattleya Trianæ.

G. R. le Doux, Esq., Langton House, East Molesey, had a bright little group of very good varieties of Cattleya Trianæ, that named C. T. Florence Le Doux, which had white sepals and petals faintly tinged with lavender-blue, and an intensely dark crimson-coloured lip (Award of Merit). A very finely-flowered plant of Odontoglossum cirrosum, Le Doux variety, and another of Cochlioda vulcanica grandiflora likewise received Awards of Merit, and the group a Silver Banksian Medal.

E. G. Wrigley, Esq., Victoria House, Dunkinfield (gr., Mr. Harris), sent Cattleya Trianæ alba, and a plant of the same, which was bought under another name, was exhibited by Chas. Ingram, Esq., Godalming (gr., Mr. T. W. Bond). J. Crispin, Esq., Fishponds, Bristol, staged a group of cut flowers of some two dozen varieties of Cypripediums (Bronze Medal). Messrs. John Laing & Son, Forest Hill, sent a plant of an extraordinary form of Dendrobium crassinode, with rather slender stems nearly 3 feet long.

Henry Little, Esq., The Barrons, Twickenham, sent a form of Cypripedium Leeanum ×; Mr. H. A. Tracy, Orchid Nursery, Amyand Park Road, Twickenham, a fine variety of C. Lathomianum ×; Messrs. W. L. Lewis & Co., Southgate, the curious little Habenaria cinnabarina, Rolfe; Chas. Winn, Esq., The Uplands, Selly Hill, Birmingham, Cypripedium "The Duke" × (=Stonei × barbatum grandiflorum), a stately flower, resembling some of the best forms of C. euryandrum ×. Thos. Statter, Esq., Stand Hall, Whitefield, Manchester, staged a plant of Cypripedium Daviesianum × (Boxalli atratum × Argus Moensii), a richly-spotted hybrid of the C. vernixium × section, in which the shining, nearly black spots visible on the petals extend almost to the tips. Mr. Statter also showed another hybrid of the C. Crossianum × section. F. W. Moore, Esq., Curator, Royal Botanic Gardens, Glasnevin, Dublin, sent cut spikes of Epidendrum xanthimum, Eria (Tænia) barbata (Botanical Certificate), a very curious species with attenuate, brown-striped flowers; and Diuris maculata (Botanical Certificate), a singular yellow-green and brown terrestrial Orchid. R. Brooman White, Esq., Arddarroch, Garelochead, N.B., sent flowers of a Cattleya, called C. Clæsiana, but which resembled a poor form of that known in gardens as C. amethystoglossa.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. G. Norman, J. Smith, H. Balderson, F. Q. Lane, J. Hudson, G. Wythes, G. Reynolds, W. Bates, J. W. Laing, A. Dean, J. Wright, W. Warren, J. Cheal, T. J. Saltmarsh, A. Veitch, P. C. M. Veitch, H. J. Pearson, A. H. Pearson, J. McIndoe, John Lee, T. F. Rivers, G. W. Cummings, and Arnold Moss.

Messrs. Rivers & Sons, Sawbridgeworth, had a small collection of Apples, of first-rate quality, mostly from orchard-house cultivation. There were Bismarck, Nancy Jackson, Wadhurst Pippin, King of Tomkin's County, Flower of Herts, Reinette Noir, Cox's Orange Pippin, Bijou, Jupp's Surprise, Reinette Dorée, &c. (Silver-gilt Knightian Medal). The same firm also contributed a collection of Orange fruits, which through the wonderful fresh and cleanly appearance of each of the first-rate fruits, did not fail to command attention and admiration. They had been taken off the plant with a few leaves attached, and these added much to their appearance. There were Seville, Whites, Long, Bittencourt, Maltese Oval, Maltese Blood, St. Michael's, Sustain, and St. Michael's Egg, beside the variegated-foliaged Orange, which produces rather small pale yellow fruits; also the Silver Orange, Dom. Louise Orange, and the Perambuco Orange (Silver Gilt Knightian Medal).

Mr. G. W. Cummins, gr. to A. H. Smee, Esq., The Grange, Wallington, staged a creditable collection of sixty varieties of Apples. The most noticeable were Cox's Orange Pippin, Pine-apple Russet, Blenheim Orange, King of the Pippins, Rosemary Russet, Bismarck, Bauman's Red Winter Reinette, Waltham Abbey Seedling, Margil, Court Pendu Plat, and Worcester Pearmain (Silver-gilt Knightian Medal).

A very large collection of Apples, consisting of some 106 dishes, was staged by Messrs. J. Cheal & Son, Crawley. The fruits were good, and represented most of the best varieties suitable for late winter and spring use. Two new ones were included, the plants of which are to be sent out in the autumn. One called Armorel, is described as a first-class flavoured fruit; it is rather small, and of pale yellow, nearly covered with dark russet. Atalanta is a medium-sized kitchen Apple. Others specially worthy of note were Cox's Orange Pippin, King of the Pippins, Swedish Reinette, Lord Derby, Lady Henniker, Annie Elizabeth, Alfriston, Lane's Prince Albert, Bess Pool, Blenheim Orange, Waltham Abbey Seedling, and Court of Wick. A few Pears were also included, such as Belle William, Marie Guisse, Chas. Cognée, Verulam, Catillac, &c. (Silver-gilt Knightian Medal).

Mr. Jno. Miller, gr. to the Lord Foley, Ruxley Lodge, Esher, showed a collection of fruit, including Grape Black Alicante and a number of dishes of creditable Apples (Bronze Knightian Medal). A box of good Mushrooms and some fruiting wood taken from Peach trees in houses and outside came from the same exhibitor.

Mr. W. H. Bannister obtained an Award of Merit for Apple Standard Bearer, showing three fine fruits. Another seedling Apple came from Mr. Jno. Clarke, Saffron Walden.

Mr. W. Roupell, Harvey Lodge, Roupell Park, staged six varieties of Apples, grown within the 5 miles radius, which went to prove that much can be done even within such a short distance of the metropolis, with energy and skill. The varieties were Smart's Prince Arthur, Beauty of Kent, Melon Apple, The Queen, Newton Wonder, and Bauman's Red Winter Reinette.

A box of Cape Peaches was exhibited by the Cape Fruit Syndicate, per P. A. Molteno, Esq. (Vote of Thanks). Three baskets of excellent Mushrooms were staged by Mr. Jas. George, 14, Redgrave Road, Putney, S.W., as packed for market; and another box of Mushrooms came from Messrs. R. & J. White, Camberwell. Mr. Laxton, Bedford, sent some Broccoli, Chou de Bedford.

EDINBURGH BOTANICAL.

February 9.—The fourth meeting of the fifty-seventh session of this society was held on the above date in the rooms, 5, St. Andrew Square, Dr. D. Christison, President, in the chair.

Mr. Lindsay, Curator of the Botanic Gardens, exhibited pots of the following plants flowered in a cold frame—Saxifraga Burseriana and Saxifraga Burseriana multiflora, both of which, but especially

the latter, formed very showy objects with their large pale flowers. He also exhibited pots of Saxifraga imbricata and Crocus chrysanthus in fine flower. Cut branches of Garrya elliptica, Hamamelis japonica, Jasminum nudiflorum, and Iris stylosa, all flowering in the open air at the Royal Botanic Garden, were laid on the table.

A branch of Ulmus campestris, showing an extraordinary development of cork in the form of large wings running along the sides of the twigs, and sent to the Society by Mrs. Astell, of Dorchester, was exhibited by Mr. Lindsay.

He also showed to the Society a short branch of Pinus sylvestris, bearing an abnormal number of cones closely crowded together below a small tuft of needles at the upper end of the branch, which grew at Blair Athole, and had been presented to the museum at the Royal Botanic Gardens, by J. E. Thomson, Esq., South Clerk Street, Edinburgh.

Professor Balfour exhibited two sections of a stem of Cytisus Laburnum, which showed three small stems of Ivy running up the hollow centre. The Laburnum had become decayed in the core, forming a hollow, which communicated with the exterior by a single long slit-like aperture, and it was through this that the Ivy had entered.

Mr. Terras read to the Society the first of a series of papers on the "Morphology and coarse anatomy of the British Leguminosæ." He took for his subject the common Whin, Ulex europæus, and with the aid of limelight views of the plant, described the various modes of branching and forms of leaves to be found in this common shrub. In the discussion which followed the reading of this paper, it was stated that the seeds of the common Whin contained the same alkaloid cytisine as that found in the seeds of the Laburnum, and that they should therefore be considered as poisonous.

Mr. R. Lindsay, Curator, read the report on the temperature and vegetation of the Royal Botanic Garden for January. During the earlier part of that month severe frost prevailed, but a change set in on the 15th, after which the temperature rose steadily to the close of the month, when fairly mild and genial weather prevailed. Falls of snow occurred frequently during the first half of the month. The thermometer was at or below freezing-point on eighteen mornings, indicating collectively 100° of frost for the month, as against 136° for the corresponding month last year. The lowest reading was registered on the morning of the 6th, when the glass went down to 9°, or 23° of frost, the lowest point reached this winter so far. No other very low readings were registered during the month, the lowest being on the 3rd, 24°; 5th, 22°; 7th, 22°; 12th, 23°. The lowest day temperature was 32°, on on the 2nd and 5th, and the highest 55° on the 31st of the month.

Of the forty selected plants where dates of flowering are annually recorded by the society, the following came into flower, viz., Dondia Epipactis on January 16, Eranthis hyemalis January 25, Galanthus plicatus January 28, G. nivalis January 30. At the same date last year only one had flowered. On the rock garden thirteen plants came into flower, as against seven last January, viz., Andromeda floribunda, Colchicum crociflorum, Erica herbacea alba, Hepatica angulosa, H. triloba vars., Helleborus purpurascens var., Helleborus torquatus, Primula variabilis, Saxifraga Burseriana, Synthyris reniformis, and three of the selected plants just mentioned. Among hardy shrubs, the most conspicuous in blossom are Jasminum nudiflorum, Garrya elliptica, Hamamelis japonica, and the autumn-flowering variety of Daphe Mezereon. The russet-brown tints of Biota orientalis, which were so prominent a feature last month, have already undergone a change. The foliage is now almost green, the transition having taken place much earlier than usual.

SCOTLAND.

ORCHIDS AT OSBORNE HOUSE, EDINBURGH.

Mr. McKelvie makes a specialty of Vandas, one house being entirely devoted to them. A Vanda suavis was 6 feet high; and a V. tricolor superba was almost as tall. Three other varieties of Vanda tricolor are grown, V. t. Veitchii, V. t. Hamilton Palace var., V. t. Dalkeith Palace var. The last mentioned, which was in flower, has a purple labellum longer and the crimson spots larger than the type. The Indian species, Vanda cœrulea and V. Denisoniana were also represented by fine plants. The house next to this one was filled with Cypripediums, some of which were in flower. A specimen of C. Stonei platytænium had ten growths upon it; Mr. White, of Ardarroch, offered a very large sum of money for this plant. Another noticeable species was C. O'Brienianum. Of other species I may mention Epidendrum ciliolare, Dendrobium Hilli, which had grown to a great size; also Cymbidium Mastersii, a winter-flowering species. One plant of Cymbidium Lowii had twelve flower-spikes upon it; and a fine bright flowering mass of Dendrobium thyrsiflorum quite enlivened the last house. The conservatory is quite unique for so small a house. On the pillars are Acacia Weismanii and A. pinifolia. On one of the stages are large specimens of Rhododendrons, including R. Walkeri, R. fragrantissimum, a seedling; and R. Nuttalli. Palms occupied the centre, tall well-developed examples of Phœnix canariensis and Kentia australis being perhaps the most noticeable. At the house end is a fernery, and a small tank for aquatics with a bottom of conglomerate or pudding stone. The Camellia-house is a misnomer, for it is devoted to Rhododendrons. This is the house in which is growing R. McKelviæ; it was raised seventeen years ago, is pure white in colour, and often 6 inches across. The late Mr. McKelvie was offered seventy guineas for it, but preferred to keep the plant intact. Mr. Findlay, the gardener, is equally at home with Orchids and plants. *Vagabond.*

The New Park for Aberdeen.

The scheme for the proposed park at Hilton, Woodside—the large and thriving district lately taken into Aberdeen under the City of Aberdeen Extension Act, has been drawn up by Mr. Dyack, Burgh Surveyor, of Aberdeen. It will be a little over 13 acres in extent, situated on a commanding position. It consists of a central area of 4 acres, laid out in grass, with ornamental grounds, the whole being surrounded with trees and shrubs. The estimated cost is £3200.

COLONIAL NOTES.

HARDINESS OF EUCALYPTUS GLOBULUS AND E. COCCIFERA.

A note appeared in one of the New York gardening publications recently, setting forth the failure of a test for hardihood with seedlings of Eucalyptus globulus and E. coccifera. As these trees grow so rapidly, and are so very distinct in character, I think they are worth planting in the south of England; even though they get frozen every few years (say eight or ten), but they will attain a large size in that period of time. The experiments at Kew should be repeated with these supposed hardy types. I have not been in communication with the Gardens since the retirement of Sir Joseph Hooker, but perhaps some one there will see this note in your columns, and pardon me for any seeming want of courtesy. Kew is not Tasmania, and I do not see how it could be expected that young soft seedlings would survive an English winter. Unripened Eucalyptus wood will not endure 1° of frost. Young trees of 12 or 14 feet high are often killed back for 3 feet or more, with the thermometer barely touching 32° Fahr., when they are growing in swampy places. On hill sides they often escape, simply because there is less frost, and the wood is better ripened. It is well known that woody trees will stand considerable frost. I have had one out here which stood 22° Fahr. I then took it in, and wintered it out of pure pity, although I had to cut off 5 or 6 feet to house it. Try again, and keep the young plants in pots until they are strong and woody. *James MacPherson, Tasmania.*

Gardening in Sierra Leone.

From private sources of information, I learn that the European residents at this station are woefully deficient in fresh vegetables of all kinds, that forage grasses are not grown there, hence baggage animals have not been introduced; most of the carrying trade being done by the native, and other negroes of the place. The soil is described as a light reddish sandy loam, and water is tolerably abundant near the barracks. The climate is said by residents to be by no means so bad now as was formerly the case, and some of the English officers are anxious to obtain Tomatos, Lettuce, and other salads, as well as fresh culinary vegetables, as some relief from the eternal tinned goods which at their best are but a poor substitute for a fresh supply. Unfortunately, there appear to be no Government gardens at Sierra Leone, as there are at Lagos and the Gold Coast, so that for the time being everything depends on private effort. If this should meet the eye of any gardening resident in the tropics, especially in Tropical Africa, I should be glad of any information as to the best kinds of vegetables and forage grasses for Sierra Leone. Of course, I know that actual trial only, on the spot, will settle the point satisfactorily, but any practical hints will meanwhile be helpful and welcome. Unfortunately there are no Chinamen in the colony, or they would soon settle this matter of fresh vegetables, as they do wherever they are colonists. *F. W. Burbidge*, 91, *Haddington Road, Dublin.*

A South African Nursery.

When Messrs. Smith commenced business some ten years ago, the student of horticultural history in this colony, had he been asked for counsel, would have given them *Mr. Punch's* celebrated advice. He would have said "Don't; see the fate of others who have gone on this mad venture." But Messrs. Smith's faith, pluck, energy, perseverance, unity, and capacity, have been rewarded, for they have to-day probably the largest nursery establishment in South Africa—certainly in the eastern province. Starting in Port Elizabeth, the poverty of the soil, with limited water supply, soon proved insufficient to enable them to cope with the growing demand for cut flowers, fruit trees, &c. Gardens were taken in Uitenhage, a town 20 miles distant, which proved so advantageous, that last year the whole nursery was removed thereto, leaving a capable florist behind to execute orders for the numerous customers here. Uitenhage is a veritable oasis in the desert. It is surrounded by mountainous hills, and is, therefore, free from the devastating winds so prevalent in South Africa; the soil is mostly a deep rich yellow loam, and from ever-flowing springs on the hills is water sufficient for irrigation—the very *sine quâ non* of successful gardening here. The Oak trees in this favoured town remind one of an English park. It may be said that the streets are a rendezvous of the trees of both hemispheres, for the Oak, the Acacia, the Grevillea, the Gum, and the Fig bow to each other guided by the breeze. You in England would like to see these growing in the streets along with Oaks, but we appreciate most the Oaks. You would be delighted to see the hedges of Pomegranate, bushes of Plumbago, with their exquisite flowers hanging so gracefully, and everywhere, where there is bush, the Ivy-leaved Geranium. It is delightful to us, but we would rather make a pilgrimage to see a Hawthorn bush.

Although glasshouses are indispensable, it will be obvious, they are not so to such a large extent as in England. Messrs. Smith Bros'. houses, frames, and plant shelters occupy a considerable space of ground, and the packing-shed, seed-store, and office are commodious, light, airy, and good enough for the Queen. Everything that is wanted for the garden can be purchased here—not only seed to sow, but implements to till the soil. Seeing the squares from whence Roses and fruit trees have been taken during the planting season to execute "esteemed orders," one exclaims with Dominie Sampson, "prodigious"! At the time of my visit, Roses were blooming in great profusion. The spring is the great Rose season, but there are always Roses, dense hedges of Reine Maries, Cloth of Gold, Madame Berard, &c, over a hundred yards long respectively,

and literally a mass of flowers. The climbing Teas and hybrid Teas give the most satisfactory results as a rule, but there are a few marked exceptions. The three above mentioned are infallibly good growers here. Of the H.P.'s, Messrs. Smith Bros. find Charles Darwin incomparable. My delight on first seeing the Cloth of Gold in this colony was unbounded. The Rose of all Roses, Maréchal Niel, does fairly well, but, of course, is not quite so robust as the others.

I need hardly add that forest trees are grown largely in this nursery. These are grown, as your readers are doubtless aware, in tins; pots are made about 6 × 4 × 6 inches from tin and zinc linings of packing-cases; two plants are dibbled in from the seedling bed, and are considered ready for planting when 18 inches high. These are generally Pines, Gums, Cypresses, and Beefwoods; P. pinaster, P. halapensis, P. insignis, and Cupressus macrocarpa are great favourites. Carnations also receive great attention. I saw an immense bed of seedlings, the seed of which came from all parts of the world. Although considerably hampered by the well-intentioned but ineffectual phylloxera regulations, causing all soil to be washed off the roots of imported plants at the landing places, new things are imported when practicable.

Messrs. Smith Bros. have also gardens devoted to market gardening, the produce of which is sent to Kimberley, a distance of nearly 450 miles, and to the "Bay" market. In nearly every newspaper in South Africa, Smith Bros. advertise. Their well-ordered establishment and well-directed enterprise have already achieved great results, and promise to achieve greater. *C. E. B., Port Elizabeth.*

BIRMINGHAM BOTANICAL GARDENS.

THIBAUDIA MACRANTHA.—A flowering specimen of this seldom-seen handsome East Indian plant is now in bloom here, and is a pretty interesting object. A coloured illustration is to be seen in the *Botanical Magazine* for 1851, wherein it is reported that the plant first flowered in 1850 in Messrs. Veitch & Son's establishment, from seed sent home from the Kola Mountains, Moulmein, by Mr. Thomas Lobb. The plant, an evergreen, has a somewhat straggling habit, and it is of easy cultivation, with large lanceolate leaves, and the flowers, of a pleasing colour, are produced on the old wood, but not in the axils of the leaves. The colour of these peculiar-shaped tubular flowers is of a creamy-white tint, streaked with pink and yellow at the base and apex.

MINIATURE AZALEA MISS BUIST.

A plant richly deserving attention, from those especially who grow for market and decorative work, is the above-named, one of the smaller-flowered hybrids of the amœna strain. It is very free-blooming, and a plant in these gardens is now literally covered with numbers of pure white flowers, which are a little larger than amœna.

CALLICARPA PURPUREA.

Every winter this handsome decorative plant is to be seen in great perfection here, and just now several fine specimens are in perfection of berry in the aquatic stove. The plants were cut back last spring to within 2 to 3 feet of the pot, and allowed to break and mature the growth, and they now have pendent shoots from 4 to 5 feet long, the greater portion of which is clothed with clusters of handsome silvery-tinted purple berries. Young shoots strike freely in the spring, and the plant thrives in a mixture of loam, peat, and sand.

CAMELLIA RETICULATA.

A fine specimen in a very large pot of this grand old Camellia, introduced from China in 1824, is now in bloom, and is in admirable health. The plant is about 10 feet high and 12 feet through, and the flowers are very fine. A fine collection of Camellias is grown here, and most of them are now in bloom, and the plants are in a very healthy condition. *W. D.*

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

Can anyone give the author of the following line, in your Answers to Correspondents? "Why dies the man whose garden Sage affords"? *Vagabond.*

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E. 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

THE following summary record of the weather for the week ending February 11, is furnished from the Meteorological Office:—

"The *weather* after being fair and colder than of late during the first day or two, became mild and unsettled, with frequent and rather heavy falls of rain in the western and northern districts, and slight falls in the east. A good many intervals of fine bright weather were experienced however in almost all parts of the kingdom.

"The *temperature* was again above the mean, the excess ranging from 1° in 'England, E. and N.E.,' to 3° in 'Ireland and Scotland.' The highest of the maxima were recorded either on the 7th or 10th, when they varied from 56° in 'England, S.,' and 55° in 'England, E.,' to 51° in 'England, N.E.,' and 50° in 'Scotland, W.' The lowest of the minima were registered on the 6th, and ranged from 20° in 'England, S.,' and 21° in 'England, E.,' to 31° in 'Scotland, W.,' 32° in 'Ireland, N.,' 34° in the 'Channel Islands,' and 36° in 'Ireland, S.'

"The *rainfall* was greatly in excess of the mean in 'Scotland, N. and W.,' and to a less extent in 'Scotland, E.,' 'Ireland, N.,' and in the western parts of England. Over eastern, central, and southern England, and in the 'Channel Islands,' the fall was a little less than the normal, while in 'Ireland, S.' it just equalled it. In isolated localities in the north of England some large amounts were recorded; thus, at Aysgarth (Yorkshire) as much as 2 inches fell between the 7th and 10th.

"The *bright sunshine* exceeded the mean in all districts, the percentage of the possible duration ranging from between 32 and 38 in most parts of 'England,' to 22 in 'Ireland, N. and England, N.W.,' and to 12 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, February 16.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

NEARLY all classes of goods reaching us lighter, consequently prices generally very firm. Several consignments of Cape fruit to hand, especially Peaches of indifferent quality, being clingstones. *James Webber, Wholesale Apple Market.*

POTATOS.

Markets since last report have been sluggish, with a downward tendency in prices.

NEW POTATOS.—Arrivals are gradually increasing, and prices vary from 10s. to 14s. for small, and 16s. to 24s. for the larger samples. *J. B. Thomas.*

SEEDS.

LONDON: *Feb.* 15.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, as might be expected, there is now a seasonable wholesale business doing. The tone all round exhibits remarkable strength. Red Clover seed especially is getting into narrow compass. Alsike, White, and Trefoil show no alteration. Spring Tares being almost unobtainable and much wanted, have suddenly jumped up several shillings per quarter. Winter Vetches are also eagerly inquired for. For White and Scarlet Runner Beans there is an improved sale. Rapeseed is somewhat dearer. In Linseed likewise the tendency is upwards. Peas and Haricots move off slowly on former terms. Mustard without alteration.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 112s.; do., inferior, 70s. to 75s.; hay, best, 80s. to 112s.; do., inferior, 65s. to 75s.; and straw, 28s. to 44s. per load.

Answers to Correspondents.

TO OUR READERS.—*The Editor begs leave to solicit from the readers and contributors to the Gardeners' Chronicle:—*

Short Practical Notes on Cultural Matters;

Early Intelligence of Local News likely to be of general interest;

Notes and Memoranda useful to the Trade;

Specimens of New or Interesting Plants, Fruits, &c.;

Drawings or Photographs of Gardens, Trees, Flowers, &c., and which if suitable for reproduction will be utilised so far as possible.

AFRICAN FLORA: *J. P.* There is no one book devoted to the flora of Africa. What a book it would be! If you mean South Africa, there is Harvey and Sonder's *Flora Capensis*, unhappily incomplete. For tropical Africa there is Oliver's *Flora of Tropical Africa*, also unhappily incomplete. Egyptian plants are described in Boissier's *Flora Orientalis* (five volumes); and there are various French treatises in which the flora of Algeria is dealt with in part. The flora of Morocco is treated of by the late John Ball in one of the volumes of the Journal of the Linnean Society.

APPLE TREE PRUNING: *E. W.* Not too late in the season to do some amount of pruning, the bulk of it being deferred to late autumn. What may be done now is to cut out, down to the older wood, all small useless or cankered shoots about the middle of the head, and the weaker of the intercrossing minor branches: the forked ends of branches reduce to one shoot, reserving the best placed and if possible the straightest and strongest. Make the stem clear of growths; and if the tree be mossy, syringe quicklime made into whitewash over the whole. Fork up the soil a few inches deep, and pour diluted manure water from the farmyard over the area. Do not mulch unless the soil is very light, sandy, or dry.

BOOKS: *P. J. G. Primer of Botany* (Hooker), 1*s.*; *Botany for Beginners* (Masters), 2*s.* 6*d.*; *Plant Life* (Masters), 2*s.* 6*d.*; *Popular Gardening* (Fish), four vols., £1 5*s.*; *Epitome of Gardening* (Moore and Masters), 3*s.* 6*d.*; *Agriculture* (Fream), 2*s.* 6*d.* We do not know, but we suppose the prices are about those given.

CŒLOGYNE SPIKES FAILING: *T. G. K.* It may have been that a temporary fall of the temperature through draught or other cause has obtained, but it is impossible for us to attribute the cause, not being acquainted with all the circumstances. One thing is certain, that there has been error in temperature or in the application of water.

CREEPER IN SHADE: —. Aristolochia Sipho; Ivy, any variety of strong growth.

CURRANT BUD MITES: *S. K.* The too well-known mite (Phytoptus ribis). Cut off all the shoots and burn them. Spraying with sulphate of copper, or Paris Green (poison), in the proportion of 1 ounce to 12 gallons of water, is recommended by the Board of Agriculture, London, S.W., which has just published a leaflet on the subject, which we recommend you to procure.

DENDROBIUM SPECIOSUM: *H. Bailey.* A grand spike of the variety Hilli, for figure of which see *Gardeners' Chronicle*, January 27, 1877. We had unfortunately omitted to notice your flower in an earlier issue.

GARDENING FOR MARKET: *S. H. O.* It would be prudent on your part to first ascertain if the landlord would permit his land to be used for growing things for sale. Remember that he can, if he so pleases, claim all buildings whose foundations are constructed in the soil, and are attached, the superstructure to the foundation, by bolts or screws. Also all trees and shrubs not way-going stock. Hot-water boilers and pipes are counted among trade utensils, and belong to the tenant. You cannot make him compensate you for anything he may claim as belonging to the freehold. Before doing anything with the land commercially, consult a solicitor.

INSECTS: *K. T. G.* The smaller insect is a weevil, Otiorhynchus sulcatus; the other a young Blatta blackbeetle. Methods of capture often given in these pages.

JUDAS TREE OF BOURBON: *O.* A question was asked, some time since, as to what tree was meant under this appellation. We now learn that it is Cossignia borbonica of De Candolle.

NAMES OF PLANTS: *Gardener.* 1, Herniaria glabra; 2, Saxifraga hypnoides; 3, Antennaria dioica; 4, probably Sedum hispanicum. The specimens are in such bad state, that we cannot name them with certainty. Certainly it is better to take up and transplant every year, but it is not absolutely necessary if the bed is in fair condition.—*H. T.* 1, Cattleya Trianæ; 2, not sent; 3, Eupatorium grandiflorum album; 4, not recognised.—*F. M.* Agrostes nebulosa, or near ally.—*J. R.* Probably a light form of Dendrobium taurinum. From whence was it imported?—*H. M.* We think the appearance of withering on the flower-spikes of your Phaius has been caused by some check, and not by disease in the plant. A cold current of air, or a sudden fall in the temperature of the house, might cause it.—*F. G.* One of the forms of Odontoglossum Andersonianum, known as O. hebraicum.—*W. H. W.* 1, Polypodium Phymatodes; 2, Blechnum occidentale; 3, one of the old forms of white Camellia japonica; 4, 4, Polypodium tenericaule; 5, Onychium japonicum; 6, Davallia polyantha.—*D. R.* 1 and 2, forms of Dendrobium lituiflorum; 3, Oncidium excavatum; 4, Saccolabium violaceum; 5, Dendrobium Pierardii; 6, Dendrobium undulatum.—*C. R.* Lopezia racemosa.

PRUNING FRUIT: *H. Schwarz.* The best book for you is *The Scientific and Profitable Culture of Fruit Trees*, by M. Du Breuil. Crosbie, Lockwood, & Co., 7, Stationers' Hall Court.

PUBLICATIONS: *M. W., Galicia. Rosarian's Year-Book; Garden*, 37, Southampton Street, Strand, London; *Gardening World*, 1, Clement's Inn, London; *Journal of Horticulture*, 171, Fleet Street, London; *Gardening Illustrated*, 37, Southampton Street, Strand, London.

THE PLANTER'S FRIEND: *E. & W. Hackett, Adelaide, South Australia.* In reply to an enquiry in your issue of November 5, 1892, by Messrs. C. Platz & Son, respecting "Planter's Friend," we send you the following:—"Planter's Friend is a species of Sorghum, which is largely cultivated in this colony, as well as New South Wales and Queensland, for summer fodder. It does not grow so high as the Sorghum saccharatum, but produces a much larger quantity of leaves, which are valuable for ensilage, &c., and are much liked by cattle and horses, being rich in saccharine matter."

VARIEGATED BRUSSELS SPROUTS: *J. F.* This is an uncommon form. It might be worth trying to perpetuate it. Can you send a stem with head and sprouts for our inspection?

VINE ROOTS: *W. H. N.* No; there is no trace of the Vine-disease (Phylloxera) in the roots sent. They are quite dead, but this is entirely the result of bad draining. If you intend to plant a Peach tree, it would be well to remove the present border soil, and see that the drainage is rendered efficient.

WEEVILS IN ORCHIDS: *W. H.* There are two or three species too common in gardens, and this is one of them.

TO FLORISTS.—A young LADY desires re-engagement; quick at Wreath-making, Posies, Sprays, &c.—Y. Z., The Nurseries, Bagshot.

HOLLOWAY'S OINTMENT AND PILLS.—Shortness of Breath, Coughs, and Colds.—Thousands of testimonials can be produced to prove the power possessed by these corrective remedies in cases of Asthma, Incipient Consumption and all Disorders of the Chest and Lungs. The Ointment, well rubbed upon the chest and back, penetrating the skin, is absorbed and carried directly to the lungs, where, in immediate contact with the whole mass of circulating blood, it neutralises or expels those impurities which are the foundation of Consumption, Asthma, Bronchitis, Pneumonia, and similar complaints. On the appearance of the first consumptive symptoms, the back and chest of the patient should be fomented with warm brine, dried with a coarse cloth, and Holloway's Ointment then well rubbed in. Its absorption will subdue advancing symptoms, and baffle this formidable foe.

GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH"

ROLLING AND COLLECTING MACHINES FOR 1893.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in **constant** *use*

at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

They are the first, foremost, and best in the world.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS.
The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "*Journal of Horticulture*," *of June 9, says:*—"MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 195,000 of these Machines have been Sold since they were first introduced in the year 1856,
And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.
They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

FEBRUARY 14, 1893.
TO MESSRS. SUTTON AND SONS,
SEEDSMEN, READING.
GENTLEMEN,—We regret that we have INFRINGED YOUR COPYRIGHT in a certain Illustration of a Residence, Tennis Lawn, and Garden, and beg to offer you our APOLOGY for having done so. We desire to state that the infringement was quite unintentional on our part, as we obtained the electro from a firm who had, we believed, the right to supply it, and we used this electro in perfect ignorance that the illustration was your Copyright. We thank you for your consideration in not taking legal proceedings against us, and we undertake not to repeat the infringement of this or any other illustration of yours. We further authorise you to publish this letter, and shall be pleased to pay any reasonable expense you have been put to in the matter.—Yours truly,
ARMITAGE AND IBBETSON,
Bradford, Yorks.

JOSEPH MEREDITH, LANDSCAPE GARDENER and GENERAL HORTICULTURIST, Snape Hall, Whitmore, Newcastle, Staffordshire.

Group 1.—Gold, Silver, and Bronze Medals and Certificates.—(*a*) Specimens of new and rare flowering trees and shrubs; (*b*) Forest flora; (*c*) Collection of seeds, cones, &c.; (*d*) Forest fauna and entomology; (*e*) Specimens of damage done to timber and growing wood by insects, &c.

Group 2.—Gold, Silver, and Bronze Medals and Certificates.—Growing Collection of Trees and Shrubs: (*a*) Deciduous and evergreen, indigenous and exotic, in classes; (*b*) Deciduous and evergreen, indigenous and acclimatised, with special reference to the grouping for effect; (*c*) Undergrowth for coverts, &c; (*d*) Fruit trees, trained.

Group 3.—Gold, Silver, and Bronze Medals.—(*a*) Garden and forest literature; (*b*) Working plans of Gardens, forests, and plantations; (*c*) Valuations and survey of estates; (*d*) Charts illustrative of the geographical distribution of trees, their adaptability to various soils, their rate of growth, &c.; of the sequence of plants, natural or artificial; (*e*) Specimens of fossil trees.

Group 4.—Gold and Silver Medals.—Hybridisation of Plants. (*a*) Specimens of a hybrid, accompanied by the two parent species or varieties, indicating which of these has furnished the pollen. (*b*) Specimens of a hybrid A × B produced by crossing the two species or varieties A and B—the plant A having furnished the pollen; and specimens of a hybrid B × A produced by the crossing of the same species or varieties A and B—the plant B having furnished the pollen. The plants A and B must accompany the hybrids.

Group 5.—Gold and Silver Medals.—Collection of Timber Specimens and Ornamental Woods, Rough and Polished: (*a*) Indigenous; (*b*) Exotic.

Group 6.—2 Gold, Silver, and Bronze Medals.—Wood-working Machinery; (*a*) Sawing, planing, moulding, lathes, &c.; (*b*) Implements and tools used in gardening and forestry; (*c*) lawn-mowers, rollers; (*d*) Digging and draining tools, axes, pruning tools, pumps, cutlery; (*e*) Appliances for the transport of timber; and (*f*) The transplanting of trees.

Group 7.—Gold Medal.—Wood Engraving, with Samples of Wood; special attention being given to the supply of Boxwood (Buxus sempervirens) or its substitutes.

Group 8.—Gold, Silver, and Bronze Medals.—(*a*) Woods used for ordnance and small-arms, backing for armour-plates, lance-stocks, &c.; (*b*) Wheels; (*c*) Sleepers and rolling stock of railways, telegraph-poles, &c; (*d*) Paving or street purposes; (*e*) Mining timber; (*f*) Bent timber.

Group 9.—Two Gold, Silver, and Bronze Medals.—(*a*) Woods used for parquetry, with examples; (*b*) Mosaic; (*c*) Wood-block flooring; (*d*) Ceilings, wainscoting, and internal wall decorations; (*e*) Household furniture.

Group 10.—Silver and Bronze Medals.—(*a*) Fibres; (*b*) Wood-pulp materials used for paper-making; (*c*) Ropes, lines, and twines; (*d*) Resins and oils; (*e*) Dyes and stains; (*f*) Barks; (*g*) Spices.

Group 11.—Gold and Silver Medals.—(*a*) Wood-carving; (*b*) Turnery; (*c*) Decorative painting on wood.

Group 12.—Gold, Silver, and Bronze Medals.—Processes for the preservation of timber.—(*a*) To resist wet and dry-rot; (*b*) To resist fire; (*c*) Paints and other wood-preserving compositions.

Group 13.—Silver and Bronze Medals.—Fertilisers and Artificial Manures.

Group 14.—Silver and Bronze Medals.—(*a*) Garden pottery; (*b*) Statuary vases; (*c*) Edgings, &c.

Group 15.—Silver and Bronze Medals.—Miscellaneous accessory Decorations to a Garden.

Group 16.—Silver and Bronze Medals.—(*a*) Fancy woodwork; (*b*) Baskets; (*c*) Bamboo canes, Willows, &c.

Group 17.—Gold, Silver, and Bronze Medals.—(*a*) Plant-houses; (*b*) Show and growing-houses; (*c*) Systems of glazing; (*d*) Heating.

Group 18.—Gold, Silver, and Bronze Medals.—(*a*) Fencing; (*b*) Gates; (*c*) Tree guards.

Group 19.—Gold, Silver, and Bronze Medals.—(*a*) Summer-houses; (*b*) Châlets, kiosks; (*c*) Garden-seats; (*d*) Flower-stands; (*e*) Boats, canoes, &c.

Group 20.—Gold, Silver, and Bronze Medals.—Distillation and Preparation of Scents, and Flowers and Woods used.

Group 21.—Gold and Silver Medals.—(*a*) Settlements in new countries, showing camps and camping contrivances; (*b*) Cultivation of Tea, Coffee, Opium, Cinchona.

Group 22.—Gold and Silver Medals.—(*a*) Sporting trophies; (*b*) Pictures of forest trees.

Group 23.—Gold and Silver Medals.—Any Exhibit not particularised in the above Groups, in furtherance of the objects of the Exhibition, will be admitted.

All exhibits must be submitted to the approval of the Executive, who retain the absolute right to admit only such exhibits as they may approve, to appoint Judges, and award the Medals and Certificates. The Judges will be instructed to recommend additional medals should they think any exhibit worthy of special distinction; and the right is also reserved to withhold medals offered in any group should the Judges determine that the exhibit is not sufficiently meritorious. Application Forms, copies of the Rules and Regulations, and all particulars, can be obtained on application to the Secretary.

Testimonials.

"Shirburn Castle, January 5, 1890.

"SIR,—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACCLESFIELD."

"Hornby Castle, Lancaster, February, 1890.

"Major FOSTER has much pleasure in stating that the vineries and forcing-houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.

"Sir HENRY INGILBY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep it in repair."

UP TO DATE PEAS.

CARTERS' DAISY.

(THE MOST DELICIOUS FLAVOURED PEA.)

A new dwarf sweet-flavoured Marrowfat Pea.

A Fellow of the Royal Society who inspected our Crop of DAISY PEAS, says:—

"Many have seen illustrations of rows of Pea-haulms propped up and supported by the ripening pods, and many have smiled sceptically at what they considered the playful imagination of the artist. A visit to Messrs. Carters' field of Daisy Peas suffice to show that had the artist been present at Bromley he would not have had to tax his imagination much. There were about three acres under growth in rows three feet apart, and throughout the crop was uniformly large"

Awarded two years in succession the highest honours of the Royal Horticultural Society after thorough trial.

Price in Sealed Packets, 3/- per ½ pint; 5/- per ½ pint, post free.

For full description, see Carters' Illustrated Catalogue, post free on application

WHEELER'S

NEW POTATO,

"THE ALDERMAN."

For Exhibition this Potato is a model—the eyes are shallow, the skin rough; it is of large size, a great cropper, and of the finest possible quality; it withstands disease well, and is one of the most profitable Potatos to grow.

Price 4/- per peck; 12/6 per bushel.

"I am specially pleased with 'THE ALDERMAN' Potato, and consider it one of the most valuable introductions."—J. H. FRY.

"From the 3 lb. ALDERMAN POTATOS I raised 93 lb. grand tubers, many weighing from 1 lb. to 1⅓ lb., and when cooked they are very white and floury, and for quality unsurpassed. This crop was grown in wet and poor soil, and not one diseased in the crop.'—E. CRUMP.

Upwards of a hundred other testimonials, copy of which may be had gratis and post-free on application.

THOMAS RIVERS & SON,

THE NURSERIES,

SAWBRIDGEWORTH, HERTS.

WEBBS' NEW POTATO, 'EXPRESS.'

NOW OFFERED FOR THE FIRST TIME.

6s. per peck of 14 lb.;
21s. per bushel of 56 lb.

This new introduction, which has been raised and tested on our own farms, is a most valuable variety for early use, as it arrives quickly at maturity. It is a seedling from Beauty of Hebron, and comes into use even before that well-known Potato. The tubers are of good size, oval-shaped, with clear smooth skin, whilst the flesh is white, firm, and of the finest quality. It cooks well when first lifted, and is also an excellent keeper.

See Webbs' Spring Catalogue, Post free, 1s.

WEBBS, WORDSLEY, STOURBRIDGE.

VEITCHS'
SUPERB
BROCCOLI

FOR A COMPLETE SUCCESSION.
Unequalled for exhibition purposes, table use, or profit.

VEITCHS' SELF-PROTECTING AUTUMN

A very valuable Broccoli for autumn and early winter use, with beautifully white firm heads, which are thoroughly protected by the foliage, and remain a long time fit for use. It is extremely valuable as a succession to our Autumn Giant Cauliflower, which has met with so much approval.
Per packet, 1s.; per ounce, 2s.

VEITCHS' FINE SPRING WHITE.

Very early, heads medium size, beautifully white and compact, and well protected, of excellent quality; strongly recommended. **Per packet, 1s. 6d.**

VEITCHS' MAIN CROP.

A magnificent Variety of robust, hardy constitution, and compact growth, succeeding Veitch's Spring White, large, solid, snow-white, well-protected heads of finest quality. Certainly the best variety for main crop for use in spring.
Per packet, 1s. 6d.

VEITCHS' MODEL.

FIRST CLASS CERTIFICATE ROYAL HORT. SOCIETY.
This splendid variety well merits the high encomiums so frequently expressed in the Gardening Press, being the best and handsomest of all late Broccoli. **Per pkt., 1s. 6d.**

For full descriptions of the above, and many other CHOICE NOVELTIES and SPECIALTIES, see SEED CATALOGUE for 1893, *forwarded gratis and post-free on application.*

THE
Gardeners' Chronicle.
SATURDAY, FEBRUARY 25, 1893.

ROSES.

THE period of the year at which we are now arrived, is one that occasions many searchings of heart to the Rose grower, whether he be one who grows for exhibition or for his own home pleasure, for he has to look on his garden and see what harm the winter, which he fondly hopes is now past, may have done him, and especially will his anxiety be increased if he be a grower of Tea Roses; for, notwithstanding all that has been said of them, they are unquestionably more tender than the bulk of hybrid perpetuals. I say the bulk, for there are some, especially those which give evidence of a good deal of Tea-blood in them, which are quite as easily affected by frost; while there are others naturally weak which succumb to a good many causes, amongst which frost may be reckoned as one, I mean such Roses as Xavier Olibo, Horace Vernet, &c.

We had two exceptionally hard winters in the years 1890—91, and 1891—92; and many Rose growers have told of the desolation amongst a great many of their plants, especially the Tea Roses; the loudest wail came from East Anglia, where the destruction amongst Teas especially was very severe. The past winter, if we may use that term, has not been so severe, but when the temperature falls, as it has done in many places, to 12°, a Rose-grower naturally looks for some damage; happily, the low reading was not of long duration, and I am hopeful from looking at my own small Rose garden, and from what I hear of some of my friends, that the damage has not been very great, but I daresay we shall hear more of this by-and-by.

The appearance of my own Rose garden, and that of many others at the present time, is more like that of a farmyard than a garden; the long litter that was placed round the plants in the autumn has had, by the heavy rains and sun, all the shorter material beaten down, and the long strawy part is very much in evidence—and here, I think, it had better be left for two or three weeks longer, in fact, until the time for pruning comes on. It is, perhaps, not likely that we shall have very severe frosts now, but still the protection will be not without its use, and it cannot very well interfere with the plants, as, unless any exceptional weather comes on, there is not likely to be any starting of the buds. When I say not much damage was done, I ought to have excluded budded plants, for a neighbour (Mr. Foster) told me that he had lost five out of six of his buds.

PRUNING.—Although it will in most places be too soon to commence the work of pruning—than which there is nothing more important, and one on which the well-being of the plants depend more than on anything else—it is early yet, but perhaps before these lines appear, the time will be at hand

*

and therefore, taking time by the forelock, I proceed to make some remarks as to what I consider the most important points. There are some persons who advocate what is called hard-pruning, and some who do not; but nothing can be more incorrect than to suppose that either one system or the other is the universal rule on the subject. It is worse than useless, for it is positively harmful, to take a pruning-knife and go through a collection of Roses and apply the same hard and fast rule to all, even to all of one class, say, hybrid perpetuals, for what would be good for one would be injurious to another. It is, I think, a very fair rule to lay down, that the stronger-growing the plant, the less pruning does it require, and the weaker the growth, the harder the pruning; for, of course, the object is to induce growth, and if we take such varieties as Etienne Levet or Madame Clemence Joigneaux, the result of hard-pruning is that the plant starts off at once for vigorous growth, to the consequent loss of bloom. There are, too, amongst the H.P.'s some which are almost summer Roses, such as Madame Gabrielle Luizet, and like them, do not require much pruning; while, on the other hand, Roses of weak and delicate growth, like Horace Vernet, Xavier Olibo, Lady Mary Fitzwilliam, Duke of Wellington, and, it may be, Gustave Piganeau (although it is hardly fair to decide about that yet), require to be cut very close, in order to induce that growth which the more vigorous kinds are inclined to give. By hard-pruning, I mean to about three or four eyes. As I have before stated, my plan is to cut out, early in October, all the bloomed wood which is perfectly useless for another year's blooming, and to leave only the vigorous shoots, on which we depend for the next year's bloom; this allows a freer circulation to the wood that is left, and besides it makes the work of pruning more easy at a time of the year when there is so much to be done. In all cases it is advisable to, if possible, cut the shoot at an eye which points outward. Of course, this system of pruning is not designed for the purpose of making pretty bushes, but of getting the best blooms possible.

This pruning, as far as the hybrid perpetuals is concerned, had better be done in March, the time of the month varying according to the locality; in cold climates and heavy soils, it will be better to defer it until later in the month. It is with them as with fruits, and a few hundred yards may make all the difference, just as is the case with Hops. I have two Hop gardens in my mind now, which are only separated by the width of a road; but while one is about the best in the parish, the other was grubbed because crop after crop failed. As a general rule, about the middle of March is the best time, but each grower will be regulated by local circumstances.

With regard to Teas, it will be necessary in passing to consider their wants also: some varieties, like Marie van Houtte or Madame Lambard are such vigorous growers that they may be treated like the strong-growing hybrid perpetuals, and not be pruned hard; while others, such as Comtesse de Nadaillac, weaker growers, must be pruned hard. Here, again, the judgment and experience of the grower must be brought to bear on his plants; the middle of April will, in many localities, be about the best time for pruning this class, and position and elevation will be large factors in the matter.

When all the pruning is over, my plan is to make up the beds for the summer; for this purpose all the long litter which has been used for protection is taken away, and the very short is gently forked into the beds, which are afterwards worked over with the fork and made tidy. Of course, the exhibitor will hold up his hands at such a practice; he will say, what about the nutriment the Roses all require during the summer to get fine blooms? I do not care for extra blooms, and therefore prefer seeing the Rose-beds neat and well-arranged. Exhibitors often at this season put a fresh mulching of manure, so as to give greater vigour to the plants, and thereby produce good fat buds for exhibiting. I am content with giving mine liquid-manure, and if the weather be dry, a good soaking of water two or three times a week.

I have said nothing of the summer Roses, many of which are once more coming into favour; but in truth, with the exception of cutting any straggling branches and shortening very lightly the flowering shoots, they do not require the knife. The same may be said of the single Roses, which are now coming so much into fashion; very beautiful they are, if evanescent—a fault which they recompense by their large quantity of bloom and the great space many of them cover. *Wild Rose.*

New or Noteworthy Plants.

PHAIUS AMABILIS ×, *new garden hybrid* (Grandifolius ♀, tuberculosus ♂).

Yet another valuable addition to our garden Orchids has flowered with the raisers, Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, and has been awarded a First-class Certificate by the Orchid Committee of the Royal Horticultural Society. As is usual with these hybrids, the plant itself is in appearance fairly intermediate between the two parents indicated above; that is to say, the habit of P. amabilis × is much dwarfer than that of P. grandifolius, and the pseudobulbs have more of the fusiform character of those of P. tuberculosus. The plant first flowered had an inflorescence of four flowers borne on a scape about 1 foot in height, and for the size and form of the flower the accompanying illustration (fig. 32), will give sufficient indication, while a reference to the illustration of P. tuberculosus (fig. 35, p. 237), will show the main points of difference between it and the new variety. P. amabilis × has white sepals and petals tinged with rose on the face; lip claret-coloured, with darker purplish lines on a whitish ground at the base inside, the base of the labellum being yellow on the outside. As will be seen, the edge of the labellum is beautifully crimped, and the whole flower has a very attractive and distinct appearance. *James O'Brien.*

Galanthus byzantinus, *Baker, n. sp.**

This new Snowdrop is intermediate between G. plicatus and G. Elwesii. It has glaucous leaves broadly channelled down the face, with distinctly reflexed edges, as in the former and inner perianth-segments marked with green, not only at the top, but also on the lower part of the back, as in the latter. The few flowers that I have seen are smaller than in some of the many forms of Elwesii, but the size of the flowers is of no value as a specific character in Snowdrop, and there seem to be large-flowered forms and small-flowered forms of all the known species. I think I saw the present plant last year, but the specimens were poor. This spring I have had good specimens sent by Mr. James Allen, with whom it flowered the first week in February at Shepton Mallet, and by Messrs. T. S. Ware & Co., with whom it flowered the second week in February at Tottenham. It grows freely, and I believe there is already a good stock of it in the country.

Bulb middle-sized, globose. Leaves at the flowering time shorter than the scape, 3 inches broad, glaucous on both sides, especially beneath, broadly channelled down the face, the margins as in the Crimean Snowdrop distinctly and permanently recurved. Scape slender, half a foot long; spathe linear, deeply channelled down the face; pedicel as long as or shorter than the spathe. Ovary obovate, hardly at all glaucous. Outer segments of the perianth oblong, convex on the back, ¾ inch long, ⅓ inch broad. Inner segments of the perianth half as long as the outer, obovate-cuneate, deeply emarginate with a green horseshoe-shaped mark round the sinus, the edge of the lobes rather reflexed and crisped, and another green blotch covering the lower part of their back. Stamens much shorter than the inner segments; anthers orange, very apiculate.

* *Galanthus byzantinus*, Baker, n. sp.—Bulbo globoso; foliis glaucis facie late canaliculatis marginibus recurvatis; ovario obovoideo viridi; perianthii segmentis exterioribus oblongis dorso convexis, segmentis interioribus duplo brevioribus apice profunde emarginatis lobis quadratis dorso et apice viridi maculatis; antheris apiculatis,

Crocus Tauri, *Maw, var. melanthorus, Baker.*

Last year Mr. Whittall introduced this fine species into cultivation for the first time from the neighbourhood of Smyrna, and now Mr. Jas. Allen has sent me a form with black anthers. The species is figured in Maw's *Monograph*, tab. 64, and described in my *Handbook of Irideæ*, p. 80. Its alliance in corm and leaf is with C. biflorus, but the flowers are bright lilac, with a yellow throat, like those of C. Sieberi. It flowers with Mr. Allen early in February.

Galanthus Elwesii var. robustus.

Messrs. Damman & Co. have sent me from Asia Minor a very robust variety of G. Elwesii, with a large bulb and a thick glaucous leaf. The flowers are scarcely so large (I speak from a single specimen only) as in the original form figured in the *Botanical Magazine*, t. 6166, but the outer segments of the perianth are narrowed into a more distinct haft. *J. G. Baker.*

NEW ORCHIDS.

Dendrobium Rubens × (D. Leechianum ♀, D. nobile nobilius ♂), *new gard. hyb.*

This very handsome hybrid, as showy in its way as D. Wardianum, comes from Mr. J. Cypher, Queen's Road Nursery, Cheltenham. The sepals are broad and flat, 3½ inches across, white, tinged with the peculiar purplish-crimson of D. nobile nobilius on the outer halves and reverse side; petals nearly 4 inches across and 1 inch in width, white, with a purplish-crimson margin, and heavier colouring of a more purple-rose hue at the tips. The lip is less acuminate at the tip than in D. Ainsworthii Leechianum ×; blush-white at the base, and with purple lines over the sides which clip the column, the middle of the lip for nearly half its area being of the richest maroon-crimson, which is encircled by a broad white band, the tip being of purplish-rose colour, like the tips of the other segments. Compared with D. Leechianum ×, it has the shining white and bright colour of D. nobile nobilius, instead of the creamy-white and duller colour of that variety, and the colouring of the lip is full, the margin of the blotch only being a little broken, and not displayed in veining as in the varieties of D. Ainsworthii. In growth and freeness of habit it resembles D. splendidissimum grandiflorum ×, and altogether it was a cross well worth making. It matters little what these hybrids are named, beautiful though they be, and the name of the great Flemish "colourist" will not be inappropriate to give it. *James O'Brien.*

Cypripedium Alfred Bleu.

A new hybrid, raised out of C. ciliolare, by insigne var. Chantini. It is figured in the current number of the *Revue Horticole*, and has a broad dorsal sepal, white, with numerous purplish-red streaks and spots, and ciliolate at the edges. The petals point downwards, and are similarly marked. The lip is reddish-brown, shining; the staminode is yellow, suborbicular, slightly notched above. The new comer was raised by M. Bleu in 1883.

Dendrobium Owenianum (Linawianum majus ♀, Wardianum ♂).

This fine hybrid was raised by Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne, and exhibited by Messrs. F. Sander & Co., St. Albans, at the meeting of the Royal Horticultural Society, February 14, when it was awarded a First-class Certificate. The pseudobulbs are stout and erect, showing markedly the swollen appearance below each joint, as seen in D. Linawianum. The flowers are borne in twos and threes on pedicels 2½ to 3 inches in length, which carry the flowers free of the pseudobulbs in a most graceful manner. The flowers are over 3½ inches across the expanded petals, which are 1 inch wide, and slightly wavy at the edge. The sepals are ligulate, the lateral ones pointed, and slightly curved back; white, faintly tinged with lilac, and tipped with rosy-purple. The petals

are ovate-oblong, slightly acuminate, pure white, tipped with rosy-purple; the lip folded over the column at the base, the blade broadly ovate, and terminating in a slightly-recurved point in the front; the base of the labellum is blush-white, from which radiate purple and dark-purplish crimson lines, which merge into a heavy blotch on the dark yellow disc; the anterior portion of the lip is pure white, tipped with rosy-purple, and the whole flower has a soft wax-like appearance.

And now comes the question of its relation to other hybrids already raised, and especially those famous plants raised in the gardens of Sir Trevor Lawrence, Bart., at Burford. To some of these it is said the present one bears a resemblance, but it is not said to which. D. Juno × and D. chlorostele × are both crosses with the ordinary D. Linawianum and D. Wardianum, but we have the record of that careful hybridist, Norman C. Cookson, Esq., that the form of D. Linawianum used was D. L. majus, of which it is said in William's *Orchid Growers' Manual*, that the flowers are "4 inches across and richer in colour than the ordinary form." I know something of the variety alluded to, for it was once in my care, but I thought it had been lost. The use of this plant would account for the larger size of the flowers, and the longer footstalks of D. Oweniana × over any others of its class, so far as I can judge of them. *J. O'B.*

Oncidium Saintlegerianum, *Rolfe.*

I know not what is meant by Oncidium spilotanthum, mentioned by Mr. Rolfe, p. 194, as having a resemblance to the above plant, but I take it that it is an erroneous rendering of O. spilopterum. I may say that the firm which first flowered specimens out of M. de Saint Leger's importation, and all others who have had an opportunity of judging, are convinced that O. Saintlegerianum is identical with the O. spilopterum so faithfully depicted, as regards bulb, leaf, flower, and general habit, in *Bot. Reg.*, xxxi., t. 40. I sincerely hope that some minor feature hidden from the general observer may save it as a distinct species, as, if not, and it should have to follow the later revision of the species, and be placed under O. Batemanianum, we shall have further complications in an already intricate subject, the synonyms at present being O. Batemanianum, syn. O. ramosum, syn. O. Pinellianum, syn. O. gallopavinum, syn. O. spilopterum, syn. O. stenopetalum of Klotzsch, and possibly others. In any case, seeing the doubts which exist in the minds of those who have flowered the plant, and the trouble Mr. Rolfe admits he had to separate it from O. spilotanthum (O. spilopterum?) until it was critically examined, I think the statement in the original description (*Gardeners' Chronicle*, Nov. 12, 1892, p. 582), "it cannot possibly be confused with any other species of this large and difficult genus," is, to say the least of it, injudicious. However, there are a large number of plants distributed in collections which will flower during the year, and the subject can be reverted to. *Jas. O'Brien.*

LILIES *VERSUS* ROSES.

I suppose that for one person who cultivates Lilies, 500 cultivate Roses. In all summer horticultural shows Roses occupy the first place, Lilies take a back seat. There are special Rose exhibitions, and a National Rose Society. The modest Lily hangs its head in obscurity. Why is this? Is the Lily inferior to the Rose? I think not. For purity of colour no Rose can touch the Lily; for fragrance, in my opinion (a matter of individual taste), no Rose can equal in delicacy the perfume of the speciosum or longiflorum group, including L. Browni, or in strength that of L. auratum. For lasting as a cut bloom, whether as regards colour or fragrance, the Lily will keep good a week. The Rose is gone in twenty-four hours. Under glass you may have Lilies all the year round in bloom, but not so Roses. For grace and stateliness, granted equal excellence of growth and cultivation to both, there is no comparison between a Rose bush and an auratum, a longiflorum, or a speciosum Lily. Whence, then, the difference in popular cultivation? I suppose that the Lily is generally held to be far more difficult to grow than the Rose, that after flowering the bulb often perishes, that renewals are costly and troublesome; but surely this is because the cultivation of the one is less understood than that of the other—a deciduous bush renews yearly only shoots and flowers. The Lily, in addition, has to make a bulb, on whose size and soundness its future life depends, hence a greater demand that its environment should be suitable, and its requirements understood by the cultivator.

Now, as regards environment, it is true many soils do not suit Lilies; they require moisture and a fair amount of sunshine—light sandy soils, therefore, do not suit, neither do heavy cold clays. Given partial shade, abundant moisture, combined with drainage, and a fairly retentive soil, Lilies will do well. If you wish to see them well done, go to Kew, and admire the beds there. Now, this environment is more restricted than that of the Rose, and it cannot be found in many gardens; but it can be had artificially. In my town garden of 20 feet by 50 feet, I grow in pots magnificent groups of L. longiflorum speciosum and other Lilies, but I take care that the pots are large enough, never using less than a 10-inch pot for a single bulb; large bulbs, or several bulbs together require a larger pot, up to 15 or 18 inches wide. Sankey's pots are deeper, and therefore give more room to the requirements of the roots. The soil used is a mixed loam, with some sand and peat to keep it open. The plants get sunshine about half the day; they are kept well watered—this is most important. If not plunged, they get soaked every evening at sunset; if plunged, every other day during growth, some Clay's fertiliser is also added. I get magnificent growth, splendidly coloured and fine blooms, and grand bulbs for the next year, and this in a tiny town garden; and if one can do this so easily, why not others? A grand lot of longiflorum and speciosum Lilies in bloom is a graceful, beautiful sight, well worth a little trouble. Greenfly does not infest my Lilies as it does my Roses, and no caterpillar eats the buds. I finish, therefore, by asking again, "If Roses, why not also Lilies?"

I could add much more in favour of Lilies, but will cite only one point. A Lily coming into flower in the open garden, if taken up carefully with its roots, may be potted off, and if well watered it will suffer no check, but will bloom well, and complete its growth. I have never heard of a Rose bush thus treated successfully, but I have often been asked incredulously, "Can these Lilies really be grown out-of-doors?" *Alexander Wallace, M.D., Colchester, February* 11.

LEAF MOULD.

(Concluded from p. 110.)

The second part of the paper by Mr. George Truffaut deals with the question of the cultivation of Vriesia, Anthurium, and Latania, in leaf-mould.

Vriesia splendens major.—A plant well known among gardeners, and much cultivated for its foliage, prettily striped with black, and for its beautiful vermilion-coloured flowers. This plant was formerly cultivated in pots, but it is now more generally grown in the open garden, in the borders of conservatories, until the formation of the bud. It is found that the best-nourished plants expand the most quickly, owing to the conditions of development being more favourable.

The young plants are at first set a few inches apart; afterwards they are set out twenty to the square yard. When fully developed, each plant has, on an average, thirteen leaves and a flower.

The following is the result of analysis of different parts of this plant:—

Dry substance in the leaves ...	21·500 per cent.
Nitrogen in leaf and flower ...	0·856 ,,
Ash for 1 oz. dry substance ...	0·087 in the leaves.
ditto ditto ...	0·070 in the flower.

Analysis of the Ash.

Potash ...	37·6 per cent.
Lime ...	19·4 ,,
Phosphoric acid ...	6·4 ,,
Silica ...	15·2 ,,

Which figures correspond to—

Carbonate of potash ...	55·20 per cent.
Phosphate of lime ...	13 97 ,,
Lime ...	11·83 ,,
Silica ...	15·20 ,,

The average weight of a plant of Vriesia is—

	Fresh.	Dry.
13 leaves (grammes) ...	53·0 ...	10·60
1 flower ,, ...	116·5 ...	34·95
Total weight of plant ...	169·5 ...	45·55

One fully-developed plant of Vriesia contains, therefore, 45·55 grammes of dry substances, and 0·3852 grammes of nitrogen. The dry substance, when burnt, gives 3 375 grammes of Ash. This amount of Ash contains—

Carbonate of potash ...	1 83 grammes
Phosphate of lime ...	0·47 ,,
Lime ...	0·393 ,,
Silica ...	0·511 ,,

Twenty plants growing upon 1 square yard of soil, therefore, consume as follows:—

	Grains.	Ounces.
Carbonate of potash ...	37·20 equal	1·306
Phosphate of lime ...	9·40 ,,	0·332
Lime ...	7·56 ,,	0·267
Silica ...	10·23 ,,	0 361
Nitrogen ...	7·70 ,,	0·272

Knowing the quantities of assimilable elements in 1 kilogramme of leaf-mould, we find that the nitrification of the mould is sufficient to furnish all the nitrogen necessary for building up the Vriesia. It produces, as we saw in a previous table, 34·45 grammes of nitric acid in six months, and the plants only require 7·7 grammes. But the plants require 9·4 grammes of phosphate and the leaf-mould can only give 5·67 grammes. Here is a deficiency of 4·33 grammes of phosphate of lime per square yard of soil. There is potash enough, the leaf-mould yielding 47 45 grammes, and the twenty plants require but 37 2 grammes. The lime and silica also exist in sufficient quantity.

Phosphoric acid is the only ingredient which is deficient in quantity. And in practice phosphatic manures have been found to have an excellent effect upon these plants. It is, therefore, recommended to apply 1 oz. of phosphate of soda to each square yard of soil in one application, which will more than suffice for all the wants of twenty plants of Vriesia.

Anthurium Scherzerianum.—The cultivation of this plant has greatly increased of late years, being suitable both as a foliage and flowering plant. Its cultivation in the outer borders of greenhouses is now customary at Versailles, and answers well. The growth is luxuriant and rapid. Artificial manures have been found to act very distinctly on this plant.

The leaves, leaf-stalks, stems, and flowers of Anthuriums have been analysed with the following results:—

Dry substance in whole plant ...	20·00 per cent.
Nitrogen in whole plant ...	2·14 ,,
Ash for 1 of dry substance ...	0·115 in the flowers.
ditto. ...	0·077 in the leaf-stalks.
ditto. ...	0·094 in the leaves.

Analysis of the Mixed Ash.

Potash ...	47·15 per cent.
Phosphoric acid ...	6·08 ,,
Lime ...	19 76 ,,
Silica ...	2·85 ,,

These figures correspond to—

Carbonate of potash ...	69·31 per cent.
Phosphate of lime ...	13·27 ,,
Lime ...	12·57 ,,
Silica ...	2 85 ,,

Full-grown plants have on an average twenty-six leaves, and a variable number of flowers.

Total weight of the leaves, fresh ...	282·36 grammes
,, ,, dry ...	55 90 ,,

Thus 55·9 grammes of dry, correspond to 282·36 grammes of fresh vegetable substance, which contains 1·196 grammes of nitrogen.

This dry substance when burnt gives 5·478 grammes of ash, and the ash contains—

Carbonate of potash	3·796	grammes
Phosphate of lime	0·726	,,
Lime	0·688	,,
Silica	0·156	,,

Twenty plants occupying 1 square yard of soil, use up—

Nitrogen	23·92	grammes
Carbonate of potash	75·94	,,
Phosphate of Lime	14·52	,,
Lime	13·76	,,
Silica	2·12	,,

The nitrifying power of leaf-mould will supply more than all the nitric nitrogen the plants can want, namely, 34·45 grammes in six months, as compared with 23·92 grammes really required as shown above. But in peat, as nitrification will only produce 11·7 grammes of nitrogen during the same period, the quantity would not suffice.

We have at the disposal of the plants in leaf-mould, 5·67 grammes of phosphate lime, as compared with 14·52 grammes required—a deficiency of 8·85. This plant largely exhausts the soil of phosphoric acid. There is also a deficiency of potash; the mould only furnishes 69·5 grammes, and twenty plants require 75·92 grammes; the difference of 6·42 grammes must be supplied in manure. It will be necessary, therefore, to add potash and phosphoric acid to leaf-mould, in order to cultivate Anthurium Scherzerianum in a rational manner. To furnish the phosphoric acid, it is recommended to apply from 1 to 1¼ oz. of phosphate soda to each square yard, with half an oz. of carbonate potash, in one application, before setting out the plants; or, instead of the former, 1½ oz. of phosphate of potash may be applied, in a single liquid application.

Latania borbonica. — This well-known Palm is extensively cultivated for its ornamental foliage. The florists of the neighbourhood of Paris obtain every spring young Latania plants from Algiers; these are placed on their arrival on hot-beds in the open air, in a soil of leaf-mould. They develop rapidly, and produce in six months three leaves on an average. Eight plants of Latania occupy about one square yard. The average weight of the leaves is 45 grammes.

The following shows the composition of a plant of Latania. The samples were taken so as to keep a proper proportion of stalks and leaves:—

Dry substance of the leaves	20·0	per cent.
Nitrogen in total plant	1·171	,,
Ash in dry substance of leaves... ...	15·4	,,
,, ,, ,, of stalks	6·0	,,
Analysis of the Ash.		
Potash	12·08	,,
Lime...	15·49	,,
Phosphoric acid	2·80	,,
Silica	59·40	,,
These figures correspond to—		
Carbonate of potash	17·50	,,
Lime...	12·08	,,
Phosphate of lime	6·12	,,
Silica	59·40	,,

Thus, with eight plants of Latania on one square yard, there will be produced twenty-four leaves in six months. These will give 360 grammes of dry substance, which may be thus divided:—

Dry substance in 24 leaves	216	grammes
,, ,, 24 stalks	144	,,

The eight plants in six months will produce 4·245 grammes of nitrogen.

The dry substance of the leaves will yield 33·264 grammes of ash, and that of the stalks 8·64 grammes; or a total of 41·904 grammes of ash for the eight plants, which may be distributed as follows:—

Carbonate of potash	7·35	grammes
Phosphate of lime	2·57	,,
Lime	5·07	,,
Silica	24·94	,,

The nitrification of the leaf-mould will more than supply the nitrogen that the Latania plants require, namely, 34·5 grammes as compared with 4·215 used. Peat will also be found to supply sufficient nitrogen.

Phosphate of lime is not deficient, there being in the leaf-mould 5·67 grammes, and the eight plants only need 2·57 grammes. Potash also is more than sufficient. Lime, and especially silica, are found in large proportion in the ashes of Latania, but these constituents are abundant in the mould.

Latania borbonica, therefore, thus grown seems able to dispense with an artificial application of manure. It may, however, be well to see whether substances immediately assimilable will stimulate its luxuriance. The good effects of night soil as a manure for this plant have long been known. It may further be remarked that Latania is often grown in soils much less fertile than leaf-mould, but it is only when leaf-mould is used that manure can be dispensed with.

The author proposes, in a subsequent article, to study the different soils used in horticulture. *J. J. Willis, Harpenden.*

THE MICHAELMAS DAISY.

THE perennial Aster is at once the most useful, showy, and easily cultivated late-flowering border plant that we possess; producing an abundance of variously coloured flowers from July to November, and long after most of the other subjects of the herbaceous border have ceased to flower. The situation of this garden is a low one, and the herbaceous borders run parallel with the River Avon, which is about 100 yards distant, but in spite of these rather unfavourable conditions, a few degrees of frost have no effect upon any of the numerous varieties of the Aster, which are growing in the borders. The Michaelmas Daisies are to gardeners a great boon, to those, who like me, have to furnish cut flowers in quantity for the decoration of apartments. The prevailing colours of the varieties now in cultivation are white, mauve, and several shades of purple. the best white is Trevelyan, the best pink Madame Soymier, and a good deep red variety is found in A. Novæ-Angliæ rubra. To those who have not as yet grown the Michaelmas Daisy in variety, I would recommend a beginning being made this season, the early spring months being very favourable for the moving of the plants, either from pots or the open ground. The plants will flourish in nearly every description of soil, but a lightish soil is better than a heavy one if it is fairly fertile. If the soil of a new border is naturally stiff and heavy, a good dressing of leaf-mould, or failing this, short manure, may be used, and wood-ashes should be incorporated with it, which is best done whilst digging or trenching it. The following is a list of the most desirable varieties cultivated in beds or borders—A. alpinus, growing 6 to 9 inches, and producing bright purple flowers in July; A. Aeris grows to 2 feet high, with pretty light blue flowers; A. Amellus, a charming variety, 2 feet high, and yielding a profusion of large light bluish-purple flowers from August until cut down by frost; A. A. bessarabicus, which attains to the height of 2½ feet, its deep purple flowers are very attractive from August onwards; A. decurrens is 2½ feet high, and its numerous and pretty mauve-coloured flowers appear in September and October; A. formosissimus displays its rosy-purple flowers in September, and grows to a height of 4 feet; A. lævigatus attains a height of 4 feet, and has mauve flowers which appear in October; A. lævis is an abundant bloomer, flowers lilac, with a yellow disc or pappus. A. longifolius is a dwarf, 1½ to 2 feet growing, free flowering variety, with short sturdy stems, being clothed with long narrow leaves, and crowned with pretty pink flowers; a Novæ-Angliæ rubra, deep red flowers in October, and grows to a height of 4 to 5 feet; A. Novæ-Angliæ is a very robust-growing variety, growing to a height of from 5 to 8 feet, according to soil and climate, the violet-purple flowers appearing in October; A. N.-A. var. pulchellus, with slightly twisted bright purple rays, and brown pappus, is a fine late-blooming variety, attaining to a height of 4 or 5 feet; A. N.-A. rubra, deep red, October, 4 to 5 feet high; A. rubra is a week or two later than the preceding variety in flowering, and the flowers are of a brighter red; A. Madame Soymier grows to a height of 1½ to 2 feet, and produces bright pink flowers in September; A. Novæ-Belgiæ Robert Parker grows to a height of between 4 and 5 feet, and produces a plentiful supply of pretty lavender-blue flowers throughout the autumn months; A. polyphytus, white flowers, 2 to 3 feet high; A. versicolor produces small flowers, white at first, changing into pink or lilac, and grows from 2 to 3 feet high.

The above-mentioned varieties of Aster look well when planted with other herbaceous plants, due regard being had to height and colour. Helianthus multiflorus, H. maximus, H. orgyalis, Rudbeckia laciniata, R. maxima, R. Newmanii, syn. speciosa, 1½ to 2½ feet, all producing large handsome golden-yellow flowers and fine leaves; Helenium autumnale, a grand border plant, with numerous clear yellow flowers, produced during the autumn; Delphiniums, Phloxes, and Montbretias.

In planting Michaelmas Daisies, due regard should be paid to the height the variety grows, and obtaining, as far as may be, desirable contrasts in colour, and the time of flowering, not group together all those which flower about the same time. In planting divided old stools, the innermost parts of big clumps should be thrown away, the outer lot of shoots bringing the finest flowers, and the roots be nicely spread out in ample holes of a depth sufficient to contain the plant without having to use much force; make the soil firm about, and afford water at the time, or as soon afterwards as the soil gets dry. Michaelmas Daisies, and the other strong-growing plants named should not be planted nearer together than 3 to 5 feet. *H. W. Ward, Longford Castle.*

TWO EARLY-BLOOMING LONICERAS.

AMONGST the pleasantly-perfumed plants which bloom early out-of-doors, Lonicera Standishii and L. fragrantissima stand first; the former, with purplish-white blooms, which appear before the leaves attain much size; the latter, a most desirable plant to grow and very fragrant, which should be universally planted. We have these shrubs growing on sheltered walls; and although there was much frost this winter, yet L. fragrantissima came into bloom towards the end of January; and I was able to cut a good handful of flowers on the 30th. This plant is growing on a west wall, and it will continue to flower throughout the present month. *East Somerset.*

A TRAVELLER'S NOTES.

(*Continued from p.* 132.)

HONG-KONG, *March* 7, 1892.—The Botanic Garden, immediately behind the town, is prettily situated. Behind it rises Mount Gough, 1825 feet, whilst below is the harbour with its shipping, and beyond the hilly, wild-looking coast of China. The gardens have been formed about thirty years, and are 20 acres in extent. Except two artificial terraces, they are on the side of a somewhat steep hill. On these terraces are flower-beds on grass-lawns, and the broad paths are of gravel, but elsewhere it has been found necessary, on account of the heavy rains, to make them of cement.

Entering by the lowest gate, but a few yards from Government House, one ascends a long flight of handsome stone steps, along the sides of which are placed many pots of pretty flowering plants—Nasturtiums, Pinks, Helianthus, Conoclinium, Heliotrope, Geraniums, Acalyphas, and dwarf bushy plants of Rhapis. On the top of these steps is the first of the terraces, some 30 yards broad, flanked on one side by an embankment supporting a public road, and covered with Ophiopogon japonicus, Nephrolepis, &c., and falling away at the other end by winding paths to another entrance. On this terrace are two large plots of grass in good condition, surrounded by spotlessly clean gravel paths, 10 feet broad. In the centre of these grass plots are four very fine specimens, perfectly even and well filled in, of Pittosporum Tobira, 18 feet in diameter. Round these are various oblong and circular beds filled with many dwarf-flowering plants, quite English in appearance, Pansies, Pinks, Heliotropes, Antirrhinums, Verbenas, Cannas, Double Daisies, Marigolds, Phlox subulata, Nasturtiums, were all flowering freely and relieved by other beds of Sanchezia, Acalypha (both clipt

low), Alternanthera, Coleus and Centaurea. It is only in winter these flowering plants live. The front of this terrace has a hedge of dwarf clipt Bamboo, with a long bed of Agaves and other Mexican plants in front, relieved by four fine specimens of Araucaria excelsa, from 45 to 50 feet high in each case. Behind this terrace is a flight of steps leading to one above. On either side are fine flowering bushes of the highly-scented Jasminum racemosum. Along the edge runs a wire fence trained with creepers, Bignonia venusta, an old Indian friend, was well in flower; and amongst others, I noticed, Clematis Meyeniana—a native of the island, Passiflora racemosa, Stephanotis floribunda, &c. In the centre of this terrace is a large stone tank with a handsome fountain in the centre, surrounded by aquatic plants, including many masses of Papyrus antiquorum, as fine as I have ever seen it, its tall leaf stalks and filamentose heads reaching a height of 6 to 7 feet, gracefully waving about in the wind. On the edge of this stone tank are many pots of flowering plants, some trained on wire globes, Geraniums, Heliotropes, Cobœa scandens, Jasmines, Abutilons, Pansies, Habrothamnus. On each side of this tank, occupying the greater part of the terrace, are large beds of Tea and China Roses, fine large bushes carrying a multitude of bloom. Behind the terrace is a broad steep walk, leading to a statue of Sir Arthur Kennedy, C.B., &c., Governor of the Island from 1872 to 1877. Remnants of an Araucaria excelsa avenue remain, and include one or two fine specimens, but typhoons have destroyed the majority.

Still ascending and bearing to the right is the road leading to Mr. Ford's new house, a handsome solid edifice erected but a few months ago by government. It is on the opposite side of the public road to this portion of the garden. Near the gate in some fine masses of Eucharis amazonica now flowering freely, are specimens of the Star-Anise of China, Illicium verum, a tall rather gaunt-looking Jacaranda mimosæfolia, and a fine pyramidal Juniperus chinensis, a truly handsome Conifer as here grown, as is Podocarpus chinensis, which is largely represented in the garden.

Passing along in the direction of the houses, I saw a very pretty tree, a native of the island, Turpinia arguta, with numerous heads of pale yellow flowers, and with thick fleshy Ardisia-like foliage. It struck me as curious how many of the China plants have this thick, crenulated foliage.

On a dead tree close to the entrance to the fernery was a specimen of Vanda concolor, having moderate-sized, dirty brown flowers with a lip of a somewhat paler tinge, scarcely a showy plant.

There are two houses, spotlessly clean, having brick beds along the sides with another in the centre, newly whitewashed, paths of cement, and roof composed of Bamboo neatly split. In the fernery were many good specimens, each with plenty of room; an enumeration of the various species is scarcely necessary, as most of those we have at home were represented—and well represented. Amongst the finest were three found wild in the island, Davallia elegans, Cibotium glaucum, producing when wild, Mr. Ford tells me, fronds 15 to 16 feet, and occasionally 20 feet long, and Angiopteris evecta. It is strange over what a wide area and under what different conditions this Fern seems to thrive. Alsophilas were also good.

The larger of the two houses was devoted to Ferns, the smaller to Orchids and a small general collection of stove plants, Anthuriums, Alocasias, Begonias, Pancratiums, and Crotons, but for these it is now rather too cold, and they did not look their best.

The Orchids looked well, perhaps because Mr. Ford does not try to grow the South American species, which here as in all other parts of the East, always seem a failure. Amongst the best here to be seen now are Cymbidiums, some fine pieces; Calanthes, particularly vestita; Vandas, Cœlogynes, of the flaccida section; Dendrobiums, densiflorum, fimbriatum, aduncum, and others; amongst which D. aggregatum was largely represented. Mr. Ford tells me he has found this wild on the Lofan Shan in South China, previous to which it was not known to exist in the region at all. He showed me the plants he brought over, they are certainly aggregatum, but it strikes me as curious they should grow in China; there is, however, no doubt about it.

Erias do well, and Anœctochilus are particularly fine, large pans of most beautifully netted and minutely veined brown glossy foliage. A. Roxburghii was the best.

Outside the plant house I recognised an old Indian friend in Pterocarpus indicus surrounded by some fine clumps of Alpinia nutans, about as fine a screen plant as one could well have.

A big bush of another Hong Kong native, Raphiolepis indica, commonly known as the "May-flower" by Europeans, on account of its numerous small lovely white flowers now being freely borne, is near a large bed of Rhododendron ledifolium, a most appropriate specific name, the foliage is the very *fac simile* of that of a Ledum. It has large white flowers.

It is curious how many plants growing in the far East, this Raphiolepis amongst the number, bear the name of indicus, when they are not known in India. Possibly it may be that, in the earlier part of the century, when specimens were taken home from the East by ships, which usually touched at India, that those entrusted with the naming had but few data to go on, and as the vessel was known to have touched at India, it was surmised the plant was there found. The Azalea is another instance.

I must not omit mention of another plant of which it is said that Mr. Ford is the only man in the island who knows the exact spot where it is found, and that he, on account of its limited area, will not divulge his secret. It is Rhodoleia Championi. Large purplish-red flowers are profusely borne all over the tree—or, rather, large bush—one in the axil of each leaf, and almost invariably several at the end of each shoot. Its foliage is oval, thick, leathery, and handsome, with very long petioles. There is also a very handsome Gardenia here—possibly G. globiflora; Francisceas or Brunfelsias do well; B. Hopeana is a mass of purple and white flowers. Perhaps the biggest tree in the garden is a Ficus retusa, with numerous large aërial roots, ranging from 3 to 9 inches, and sometimes more, in diameter. These have been conveyed from the branches above to the exact spot required, or to the one which seemed most likely to offer sufficient support to the tree in Bamboo canes filled with earth, the usual system pursued with Banyans in India.

On these roots are many Phalænopsis, rooting freely. Mr. Ford found he could not do much with them in a house, so he transferred them to this tree with marked success, possibly another proof that Epiphytes succeed better on living wood than on dead. Near this spot are some tall Camellias, now rapidly passing out of flower, and some fine Ardisia crenulata, in fine condition, freely berried.

The Molucca Oil-plant or Candle Tree, Aleurites triloba (with an entire, acuminate simple leaf!), is very handsome in these gardens, its foliage is of such a rich glossy colour. The oil for which it is famous is made from the seed. Up the trunk of one runs Pothos aurea, good, but not so fine as in the Tropics.

It is curious to walk through, say, a dozen acres, and find Pansies, Daisies, Antirrhinums, &c., as at home; Araucaria excelsa, Phalænopsis, rooting freely; Pothos aurea, with leaves a foot in diameter; a Conoclinium in flower, opposite a Pelargonium, and China Roses in front of a Stephanotis. Of course, if it were not the winter, the first three named, now growing and flowering, could not exist; whilst the last named—Araucaria, Stephanotis, and Pothos, are more or less at a standstill just now.

By this time we had concluded our circuit of the garden in this direction, and we again descended to the terrace, flanked on the side by Opuntias, of which O. Dilleni is here wild; Cycas media, with a peculiar flat, twisted leaf, handsome withal; Cereus triangularis, common in South China being found on many pagodas, houses, and monasteries, and other plants of a like description, including a fine piece of Encephalartos caffra. An interesting tree, the Coffin Wood Tree (Persea nana), said to be very valuable, as the Chinese highly prize it for coffin manufacture, is represented by a nice even specimen close to this terrace. It is of great importance of what wood a Chinaman's coffin is made, and one skilled in the art will discern a difference in two pieces of wood quite similar to even an expert European. At Shanghai, 1800 taels is said to have been once paid for a specimen of the above—a fact (or possibly a fiction) which reached Kew, and, I am told, excited much curiosity.

A fine tree, now freely seeding, much scattered about the garden, is Heteropanax fragrans, with rich dark green, thick, pendulous, pinnate foliage; it forms a most striking feature wherever it has been planted. There are some fine pieces near an avenue of Grevillea robusta.

The above are the most interesting subjects in the principal part of the gardens; there is, however, in addition to the above, a much smaller section near Mr. Ford's house, on the other side of the public road, containing many Coniferæ, and the palmetum.

Passing onwards towards this, I saw a grand plant of Magnolia fuscata, covered with its downy buds, and a specimen of Symplocos decora, flowering profusely—a most pretty sight when covered from top to bottom with its heads of white blossoms (not unlike those of the Orange), as this one was. This bush was a good one, some 15 feet high. I also saw a Cananga odorata—the Ilang-Ilang—from the greenish-yellow flowers of which a valuable scent is extracted, chiefly in Manila. It flowers in the autumn, and is just now carrying its clusters of dark blue seeds.

Among the Coniferæ are some good specimens, and amongst the most noticeable are an Araucaria Rulei, some 10 feet high, even, and well-grown; some good bushes of Podocarpus chinensis; an Araucaria Cunninghami, not less than 50 feet high; but the most striking is certainly a Queensland species—Callitris rhomboidea, the foliage of which is as thin and graceful as that of a Casuarina, but withal so thick that it forms banks of the richest pale green. The general habit of the tree is pyramidal, and it is one of the handsomest Conifers I have seen.

A good climber near here, trailing over an old Pine which it has succeeded in killing, is Cæsalpinia vernalis, a native of Hong-Kong, bearing pyramidal heads of sulphur-coloured flowers, and possessing the fine pinnate foliage characteristic of the genus. Podocarpus latifolius, with leaves 6 inches long, should do at home as chinensis does, and it is certainly handsome.

The Palms are good, though not numerous, and though only planted in 1874, have yet made fine

Fig. 32.—Phaius amabilis X. (see p. 226)

specimens, especially the Caryotas, Acanthophœnix Alexandræ from Queensland, Oreodoxa regia, Arenga saccharifera, and Rhapis flabelliformis. Livistonia australis flowers well when some 25 feet high, and Areca lutescens forms thick clumps.

Leaving the Palm-house, and passing round the edge of the gardens to Mr. Ford's house, one has a high rocky mound on one side, and a low undulating valley on the other. Over this mound trail Gleichenia dichotoma and G. longissima, the latter particularly fine; whilst in the valley below are many dozen Tree Ferns, tall Alsophila tomentosa, with stems from 10 to 12 feet high, their wavy heads being very regular and fine. Below these, many Ferns, chiefly Nephrolepis, have been planted, rendering the whole spot very pretty, and in the hot season, I should imagine, a very refreshing sight. Mr. Ford's chief work is to look after the forests of the island, instruct Chinese pupils in botany, and do much office work. *James H. Veitch.*

(To be continued.)

THE PRESERVATION OF BROCCOLI.

After every hard winter there are complaints from most parts of the country of the loss of plants from frost. This is unavoidable under the usual practice of cultivating Broccoli in loose summer-dug kitchen garden land. Some gardeners plant the early varieties on south and west borders in the front of the fruit walls, where, owing to the narrowness of the borders, 10 to 12 feet, it is an easy matter to put protection over the plants in the event of hard frost occurring in the early winter. The varieties which I commonly grew, were Early Penzance, a small white-headed Broccoli, of Cauliflower flavour, and coming into use soon after the latest Cauliflowers were finished. Of this variety, an April and a May sowing was made. Walcheren is another excellent mild flavoured early variety to precede the Early Penzance; and then come Snow's and Veitch's Winter White, Adam's Early White, a hardy dwarf form of the large French White itself, also a hardy large-headed variety; Osborne's Winter White, Sulphur a fine but rather despised variety; Knight's Protecting, Sanders' and Knight's Protecting, and Wilcove's The Ledsham is the latest variety known. The south, east, and west borders of a walled-in kitchen garden are better places for the planting of Broccolis for all seasons—much better, indeed, than the open quarters; and if the soil be not over rich or dug specially for this crop, so much greater are the chances of a crop surviving the winter. Heeling-in on the spot, or removing the plants with good root-balls in late October to sheltered land is an admirable practice, but costly in the matter of time and labour, one that cannot, therefore, be carried out by many gardeners. And the next best method to that, in so far as concerns those varieties that turn in early, is transplanting to cold pits and banked-up frames or to open sheds, i.e., sheds closed on all sides except the south.

The idea has doubtless occurred to some gardeners that, if the land in which Broccoli is planted were mulched with strawy manure in the early winter frost could be kept out of it, the roots of the plants would stand in a warm medium, and the plants would suffer less than in land which, in the course of the winter, is frequently hard frozen. This is, indeed, the method best suited for southern and south-western counties.

Sometimes Broccoli is planted on a border facing north, with a wall or hedge on the south side, with the idea of retarding the late varieties in the summer time; but this is only successful if the winter is mild—hard frosts, if continued for a week or two, causing the destruction of the plants.

Perhaps the safest place of all for late varieties is the open field, where the conditions are such as favour greater hardiness in the plant, compactness of growth, and shortness of the vulnerable part—the stem. Here a strawy mulch would act very favourably in protecting from frost, and the littery appearance would be no eyesore. *X.*

BELGIAN NOTES.

M. A. A. Pesters' Orchids.—Many remarkable Orchids are now in bloom in the houses at Brussels: Lælia albida alba, a choice variety, owing to its pure whiteness; Cypripedium Sallieri Hyeanum, an example in full beauty, with ten well-expanded flowers—an excellent variety; Odontoglossum Warscewiczi, rare and well bloomed; Cypripedium Ch. Canham, a large flower of excellent colouring; C. Ashburtoniæ expansum, a very good variety; Odontoglossum aspersum, bearing ten charming blooms.

Horticultural Meeting at Ghent on February 5.—An unwelcome return of winter prevented the members of both societies from bringing their plants to the meeting, with the exception of MM. Jules Hye-Leysen, Moens, and D. Schryver. M. Hye showed a fine collection of Orchids—1st, Odontoglossum Wilckeanum sulphureum; segments of the flower cream coloured, with a wide band of sulphur-yellow; lip very bright yellow, large indistinct blotches on all the parts—a very distinct variety. 2nd, O. macrospilum, Rchb., divisions of the flower pure white, very fine, and much spotted with blood-red; lip with yellowish ground—a very fine Odontoglossum; these two Orchids received a Certificate of Merit *par acclamation*. 3rd, Cypripedium Albertianum var. (Certificate *à l'unanimité*), a decided acquisition, already described in the *Gardeners' Chronicle*. 4th, Odontoglossum aspersum, very rare in cultivation in Belgium; flowers large and very distinctive. 5th, Dendrobium nobile nobilius, very dark in colour. 6th, Odontoglossum crispum formosum, parts large, much undulated, tips gracefully reflexed, charming flowers borne in a long cluster. 7th, O. Zaldua (*par rappel*), a capital hybrid, already described in these columns. 8th, Cypripedium Spicerianum × C. vernixium, Certificate *par acclamation* to M. Moens; a wonderful hybrid among the many acquired during the past few years. 9th, Azalea Schryveriana, to M. Paul de Schryver, a fine double flower, ground colour salmon shading into reddish flesh-colour, edged with white, nicely spotted, true to form, and which does not sport—an acquisition of proved worth (Certificate *par acclamation*).

Certificates of Merit for culture and blooming were awarded for—1st, Cypripedium Ch. Canham, a vigorous plant, foliage fine and broad, six large flowers; 2nd, Odontoglossum Pescatorei alba (*à l'unanimité*), one of the prettiest racemes of pure white flowers that we have ever seen; 3rd, Cattleya amethystoglossa, with two pretty clusters of fine bloom. These three specimen plants were from M. Jules Hye-Leysen, and were worthy of him.

Rose Culture.—A new experiment has just been made in Belgium. The firm of Van Houtte has, in a new house of considerable size, from 5000 to 6000 Roses on their own roots, and more than 3000 Roses of the best varieties intended for propagating purposes, and which, after budding, will be on sale. If the stock is not sold, it will supply a number of blooms for cutting. This experiment is worthy of attention at a time when Orchids seem to have put all other flowers out of favour.

Covering for Beds of Bulbs.—Instead of horse-dung, which sometimes contains principles injurious to the bulbs, the beds in the parks have this year been covered with Reeds, which, with care, last for three or four years, are exceedingly tidy, and permit of the furrows being left free, entail but a minimum of expense, and yet cover all the bulbs equally.

Culture of Hyacinths.—To those who do not care to go to the expense of glass vases for Hyacinth culture in rooms, the following plan may be recommended:—Ordinary flower-pots are filled with potsherds to about 2 inches of the rim, and the remaining space filled with water, the hole at the bottom being stopped up. MM. Andries & Deminter, of l'Etablissement Van Houtte, have submitted a whole series of varieties to this treatment; Hyacinthus lotus albus gave really surprising results, and we recommend the plan to all interested in bulb-culture. *Ch. de B.*

The Winter Aconite.

Eranthis hyemalis opened its first flowers on January 29, in front of our big orangery, notwithstanding heavy frost in the ground, and the lakes still covered with ice. It is astonishing how slightly this very beautiful little flower is known on the Continent. Last year a noted French gardener was amazed at our 300 feet golden row in front of our orangery, not knowing or having ever heard of it before. Snowdrops are generally fourteen days behind it in flowering in the same position. When it can be bought for 20*s.* per 1000, one would expect it to be quite as well known as are Snowdrops or Crocuses. It has the advantage, moreover, of having elegant foliage, which remains long fresh and usable after the flowers are gone. *K., Laeken.*

The Week's Work.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

HINTS ON RE-POTTING, ETC.—Oncidium Lanceanum, Cœlogyne pandurata, and Platyclinis glumacea all do well in the Dendrobium-house, and the present time is a suitable one for re-potting, &c., as the plants may be afforded water pretty freely, growth having begun. It is very necessary that everything about these plants should be sweet and clean. Our plants of Platyclinis glumacea are well advanced in growth with flower-spikes just pushing out, and require to be well attended to with water, and sometimes sponged to free them from insects. All the houses may now be advanced a few degrees in temperature, with a little more damping-down of the stages and paths.

WORK IN THE HOUSES.—By the time this is in print, we shall be nearing the period that is always a very trying one for the Orchids, when the increasing strength of the sun's rays and the biting winds we get, render great caution necessary on the part of the cultivator. The blinds will frequently have to be made use of for the reason that the ventilators may not be opened, and care is necessary at all times during the spring to avoid injury to the plants from draught. Ventilation should, as a rule, be afforded on the south side, or that from which the wind is not blowing. A greater quantity of moisture will be required, syringing amongst the pots once a day, and moistening all surfaces in the houses. The overhead syringing of the plants should be done at an early part of the morning, the plants then getting dry before nightfall. Beneath the stages in the Orchid-house, Tradescantias, Lycopodiums, Adiantum capillus-veneris, Pteris are planted, which serve the purpose of retaining moisture more effectually than bare surfaces. Cattleya Dowiana and varieties, C. Rex, C. speciosissima, C. gigas and its freer-flowering relative, C. Sanderiana, which have been resting in the cool part of the Cattleya-house since they flowered, and receiving but little water during the past four months, should now be starting into growth. Those plants which have really made a start, should be placed in a warmer part of the same house, a night temperature of 65° being suitable. Any that may stand in need of re-potting, surface-dressing, or new baskets should forthwith have attention. C. aurea, C. Rex, C. speciosissima are species which do better in baskets hung close up to the roof than in other ways; but C. gigas and those similar to it may be kept in pots placed as near to the glass as may be convenient, for unless the pseudobulbs get matured the plants are shy to bloom. Plants of Cattleya in a healthy state should not be disturbed, merely replacing old material with new without touching the roots, and soaking them in a tub of water, which will help to remove nearly all the old exhausted peat, &c. The fresh packing may consist chiefly of peat, small pieces of soft brick or clean crocks, and a very small portion of sphagnum moss. Cattleya speciosissima is a shy flowerer, to which water should be very sparingly afforded till such time as the flower-sheaths can be seen; on the other hand, plants of Cattleya crispa should be afforded water plentifully till it has flowered, the pseudobulbs now being fast made up, and sheaths pushing up. Unless this species is well-grown and well-ripened, it is rather shy. I grow this plant at the warmest part of the Cattleya-house. Plants of Lælia Boothiana, which are now forming pseudobulbs and flower-sheaths, should receive more water than hitherto, and this

must be continued till after flowering, when they must be properly dried off, afforded a thorough rest, and well exposed to sunlight. This species of Lælia flowers as soon as the pseudobulbs are made—that is, during the months of May and June. The plants of Miltonia vexillaria, Odontoglossum Roezlii, and Phalænopsis having been pot-dressed with live sphagnum moss, they should be well syringed overhead and generally kept moist; it helps to keep down the pest which troubles these plants so much.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

CONSERVATORY CLIMBERS.—If the shoots were regulated in October, not much will be required in the way of training now; remove any dead shoots or leaves, and thoroughly clean any that may be infested with scale or mealy-bug, and syringe with lemon-oil or parafin insecticide. If Tacsonias or Bignonias, which are often subject to the attacks of these pests, are in a bad state, a weekly syringing is a good plan at places where the conservatory adjoins the mansion. Advantage should be taken to fumigate and clean when the family are absent. Where the conservatory is large and lofty, the expenses of a weekly syringing with advertised insecticides would be heavy. A good and cheap wash may be made from one wineglassful of parafin to 4 galls. of water. This should be kept thoroughly mixed by one person syringing into the bucket, whilst another is delivering it on to the plants. If this is carefully followed up for six or eight weeks, it will clear the house of any insect filth without injury to the plants. This is not recommended for soft-wooded plants, but for climbing plants, Palms, Orange trees, Rhododendrons, and such things. The borders of climbing plants should be pricked over, and receive a good top-dressing of manure and soil, and where the leaders have been kept rather dry during the winter, a good watering should be given. Lapagerias that are planted in borders are best kept rather dry during the winter; those in pots require more water, and are best trained on string, so that they can be removed and trained on wire trainers when required. A good and sweet-scented climber for flowering in March is Stauntonia latifolia; it is hardy in some parts of the kingdom, and has bright evergreen foliage, flowers red and green, not showy, but very fragrant. Where there is room for the old hardy Wistaria sinensis in greenhouse or conservatory, on a spare wall or pillar, it should be planted; also the old Aloysia citriodora will be very useful for cutting purposes. Other sweet plants are Jasminum grandiflorum, J. revolutum, and Olea fragrans. Other good climbing plants are Tacsonia hybrida, T. exoniensis, Solanum jasminiflorum, Bignonia Chamberlainii, B. cherere, Tecoma jasminoides, Banksian Roses, white and yellow; Cobœa scandens variegata, Plumbago capensis, Bougainvillea glabra, and Asparagus plumosus nanus; this last-named should be planted in quantities for cutting purposes; it does well against a wall. A useful plant for a rough wall or rockwork is Ficus repens. Useful trailing plants for baskets or vases in fernery or conservatory are Dracæna Vipani, and Tradescantia zebrina. Make new borders for climbers, where any new plants are required to fill up vacancies. Drain well, and give good turfy loam, leaf-mould, rough peat, and sand in abundance.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

PROTECTING FRUIT BLOSSOM.—Unusually mild weather has hastened the buds upon Peaches and Apricots, and preparations must at once be made to protect the blossoms immediately they begin to disclose. I am no believer in elaborate fixtures, such as glass copings, permanent arrangements for Frigi-domo, or any other warm material on rollers, and believe that many crops have been lost, owing to a disposition upon a damp night to run the risk of frost rather than that of letting down the blinds, which may be followed by a storm, and consequently by the blinds being blown against the buds. A more simple and effective method is to fix an 11-inch board directly under the coping, with irons, to which should be hung two or three thicknesses of netting, simply placed over tenter or other hooks put in the boards and then pegged down in the border, to prevent the netting being blown against the trees. This method of protection, too, is more sightly than the more common one of using long heavy poles to keep the nets from the trees, and is also more convenient to the amateur, and those living in districts where poles are not easily obtained.

FIGS ON WALLS.—If these still remain thickly protected, and especially if the protection be hay or straw bands, take advantage of mild weather to remove such entirely. Prune and secure the branches to the wall, protecting again at once with the system recommended for Peaches, &c.

PRUNING THE TREES.—In pruning, remove all long naked branches, and rather depend more upon young wood of the previous season than thickly-spurred branches, which afford so much growth in the summer that not only is the fruit difficult to find, but being thus buried away from the sun's influence, is longer in coming to maturity.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

HINTS ON PRESSING WORK.—Owing to the showery weather, work entailing treading the ground will, in some gardens, have got somewhat delayed, especially on retentive soils, and where this is the case, advantage should be taken of every opportunity when it can be done to expedite the same. The digging of all the vacant plots should not be longer delayed, unless the land be very light, when it is better dug just before the crop is sown or planted. Work in other departments will soon be so pressing that gardeners will sometimes be puzzled to know what to do first; and, as in these days most places are under-manned, the exercise of forethought may prove of much value. See that the Pea-sticks are got ready for use, tying them in bundles according to their sizes. While the cropping land is still too soft to tread upon, weeds may be pulled out of the gravel-walks, Box-edgings, and other places which cannot be cleaned with the hoe and rake.

HOTBED PITS AND FRAMES.—These are important for forwarding a variety of things; and regular attention must be paid them during the coming month, and the preparation of materials for new beds, linings to old ones, and partial renewals. The sun is sometimes powerful at this time, and it becomes needful to admit air freely to the frames; and unless this is done, plants of whatever kind will become spindly and often useless. At the same time, the nights are cold, and it is necessary to cover the glass to maintain the proper degree of heat. Vegetables, especially whilst still small, require much attention in pits and frames during the prevalence of north or north-east winds, the temperature being apt in bright sunshine to rise considerably, and air from outside must not be admitted, so that it shall not check growth. It is desirable to put pieces of hexagon cotton netting, or similar materials, over the ventilating inlets affording air. If possible, ventilate on the opposite side of the frame to the direction of the wind. Carrots should be thinned to a distance of 2 inches apart each way. Radishes, Lettuces, Brussels Sprouts, Cauliflowers, Cabbages, and the like, should be allowed sufficient space to grow sturdily.

POTATOS.—Those in pits ready for lifting for table use should have the soil kept sufficiently moist to prevent the skins of the tubers from "setting;" at the same time, the use of much water should be avoided, or flavour may suffer. Earth-up those needing it, using a light, rich soil for this purpose. Another planting may be made in warm beds in pits or frames, as these will be cleared off before those planted in the cold frames are ready for table. Where any Potato stems are showing through the soil, the lights should be covered at night with straw, Fern, or double-mats. A few tubers of early varieties may now be planted at the foot of a south wall, covering them to forward growth with potting-bench soil.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

HERBACEOUS BORDERS.—The continued mild weather has caused many of the plants to show signs of growth, and no time should be lost in looking over the same, making any alterations that are required. If the clumps are overcrowding one another, they should be lifted and divided, replacing the strongest pieces, which are generally found on the outside of the clump. These remarks apply chiefly to such things as Phloxes, Asters, Pyrethrums, Helianthus, &c., and not to any of the early-flowering plants. The same process should be applied to the rockery, for no matter how carefully it has been planted, some of the plants will get too large for their places; and I find February a good month for curtailing the root-growth of strong-growing plants. But the best way is to remove them, and plant elsewhere, particularly if they are over-growing a more choice plant. It often happens when forming a rockery, that, in order to get the place furnished quickly, the gardener uses plants that had better been left out, and these errors have to be corrected.

Cuttings and Seeds.—Continue to take cuttings of bedding-plants as fast as they are produced, and as soon as they are properly rooted, put them into boxes, and keep close for a time; they will soon commence to grow, and the tops can then be taken off and struck, if sufficient cuttings cannot be obtained from the stock plants. East Lothian and Intermediate Stocks should be sown in pans or in frames close to the glass, and as soon as they are large enough to be handled, should be put into pots, placing three to six round the edge of the pot, according to the size used, and kept in a cool frame till April, when they should be planted outdoors, and they will form a nice succession of bloom to the Ten-week Stocks.

FRUITS UNDER GLASS.

By Jas. Whitton, *Gardener, Glamis Castle, Glamis, N.B.*

BANANAS.—Plants that showed fruit during the autumn months will now require supplies of liquid manure to enable them to finish up the swelling of the fruits in a satisfactory manner. Keep up a hot moist atmosphere until the fruits begin to show colour, after which a drier air is necessary to prevent the fruits spotting. It may be found necessary to cut the bunch, if so, hang it in a dry room in which a temperature of 50° to 55° is kept. Although the fruit will keep longer when so treated, the flavour is not so rich as when they are gathered fresh from the plants. Immediately the branch is cut, remove the old stem, and select the strongest sucker for succession, destroying all the others. Frequently one of the suckers is left, which pushes up about same time as the fruit, and during the winter months it gets stunted. If this is the case, destroy such, and allow a fresh one to start. Those which grow up 3 or 4 feet high before beginning to unfold their leaves make the best plants and produce the finest bunches of fruit. Clear out all effete soil, and give the beds a top-dressing of good rough material. Should the soil be exhausted, renew the beds entirely, as Bananas repay generous treatment. Light turfy loam, rough leaf-mould, and dried cow-manure, in the proportion of one of the latter to two of the former, will be found suitable. Do not make the beds too firm, as the plants luxuriate in a loose, free-rooting medium. As the plants grow, give them occasional doses of liquid manure, and a pinch of nitrate of soda, after the fruits show. Where beds with bottom-heat are not available, Bananas can be successfully grown in large pots or tubs, although they rarely produce such large bunches of fruit. The same treatment in the matter of soil and selection of suckers will do, but endeavour in all cases to get a quick, free growth.

PEACHES AND NECTARINES.—Once the fruits have fairly began to swell, the temperature of the early house may be increased a few degrees. Disbudding should be finished by the time the young growths are an inch long. The thinning of fruits must also be done carefully and judiciously. Leave a few more than a good crop, as a proportion usually fail during stoning. At the same time do not overload and weaken the trees with a superabundance of fruits not intended to be left to ripen. Many cases of failure in stoning arise through that cause. In bright weather the trees should be syringed before nine o'clock, and again in afternoon when shutting-up the house to prevent greenfly, and to promote free growth. In dull weather once a day will suffice, preferably in the morning. Attend to the fertilisation of flowers in succession-houses, and keep the late houses as open as possible, for the buds on late trees are advancing rapidly with the mild fresh weather we are experiencing.

CHERRIES.—Those in bloom will require daily attention in the way of fertilising the blooms. On bright days a light dewing with the hand syringe will benefit them greatly. Take great care not to overheat the house, and keep up a free circulation of air. A dry hot atmosphere or a damp stagnant one is fatal to success.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

PLANTS, &c., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

LOCAL NEWS.—*Correspondents will greatly oblige by sending be the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

ILLUSTRATIONS.—*Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.*

NEWSPAPERS.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

THURSDAY, MAR. 2—Linnean Society.

FRIDAY, MAR. 3—Dundee Horticultural Association.

SALES.

MONDAY, FEB 27 { Roses, Carnations, Tubers, and Sea-kale, at Protheroe & Morris' Rooms.

TUESDAY, FEB. 28 { Odontoglossum crispum and other Orchids, at Protheroe & Morris' Rooms.

WEDNESDAY, MAR. 1 { Japanese Lilies, Tree Ferns, 2500 Lilium Harrisii, Roses, Begonias, &c., at Protheroe & Morris' Rooms.

THURSDAY, MAR. 2 { Hardy Plants and Bulbs, and Greenhouse Plants at Messrs. Protheroe & Morris' Rooms.

FRIDAY, MAR. 3 { Orchids from Messrs. Charlesworth, Shuttleworth & Co.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40°.6.

Paris Market Gardening and Liquid Manure.

IN our issue for February 18, we noticed the publication of a small work on the cultivation of market plants by M. ERNEST BERGER (Paris, J. B. BAILLIÈRE ET FILS). *Apropos* of the subject-matter of this book, we append the following remarks respecting the manufacture and uses of manure-water by Parisian gardeners, which are taken from the *Illustrierte Nützliche Blätter* for the present month.

After referring in terms of commendation to the excellence of the Paris market vegetables, a fact chiefly due to the abundant use of liquid-manure, it asks, "Whence comes this manure?" Guano, which one usually employs, is expensive, and it is, morever, often of indifferent quality and much adulterated; and other much-vaunted manures are of doubtful usefulness, and in any case cost money. The French gardener is, as a rule, very moderate, not to say parsimonious, in his expenditure; and although he endeavours to put the best and finest productions on the market, he avoids as much as possible the spending of money; as it is, the cost of labour is sufficiently high. The practice of making liquid-manure is very simple and not new, but in spite of the scarcity of manures in some parts of the continent, it is much too little in use.

A visit to the market gardens in the vicinity of Paris, would disclose everywhere in the neighbourhood of the usual tubs for holding water, others which are sunk in the ground. These latter are used for the manufacture and storage of liquid-manure, which is everywhere employed with the greatest care. In these tubs are put wood-ashes, the dung of fowls, rabbits, and other domestic animals, urine, the contents of cesspools and closets, soap-suds, slops from the kitchen, soot, offal, and trimmings; and to these a few pounds of sulphate of iron are added, which of itself is not only a manure, but it neutralises the evil odour of the contents of the tub, which is then filled with water. This done, the whole is well stirred about, and left for fourteen days without further disturbance to ferment, after which time it is suitable for use. This is done in the following manner,—a small basin is made round about each plant or small group of plants, and filled with liquid from the manure-tubs, which seldom exceeds in quantity half a litre= two-thirds of a pint; the quantity depending on the size of the plants, it having been found that "little and often" has better effects on plant growth than one or two abundant applications. Soon after the dose of manure-water is dispensed, in case no rain should have fallen, clean water is copiously applied. That the impoverished materials in the tubs are constantly being replaced with fresh, goes without saying.

Those who have not seen these practices of the French gardeners, can form no idea of the powerful effect that these manurial waterings have on vegetation. Of the greatest use in bringing culinary vegetables to market at an early date, they have also the best effects on fruit trees, Vines, small fruits, &c.; and in very diluted form, on all kinds of plants grown in pots.

Many of our amateur and other readers who now let valuable manures go to waste will, we venture to think, do well to take a leaf out of our continental neighbour's book in this matter of the manure-water tub.

WISTARIA.—Our illustration (fig. 33), from a photograph for which we are indebted to Mr. JAMES H. VEITCH, whose letters are appearing in our columns, shows the use which the Japanese make of this climber. If we cannot rival the beauty of the tree as it grows in China and Japan, we can see enough to make us thankful for its extreme loveliness. We have the white and the double varieties also, but neither of them is equal to the original form. The following extract from Mr. DOUGLAS SLADEN'S *Japs at Home*, p. 256, supplies what further explanation is needed:—"At Kameido one has to cross over the famous horseshoe bridge, the arch of which is so steep that it has steps like a treadmill up its back, to a tea-house formed by a natural arbour of Wistaria—such Wistaria! I doubt if the world has its equal. The arbour stands on the water's-edge, and in May, when the Fugi, as the Japanese have named the Wistaria, after their peerless mountain, is in full bloom, the water is swept by vast feathery racemes of delicate lilac-coloured blossom 3 or 4 feet long, odorous of honey, and buzzing with bees. Japanese bees have learned (very likely the Japanese have educated them, as they educate Fir-trees to dwarf themselves, and Plum-trees to tie themselves up into knots) not to take the slightest notice of people who go to drink tea in their honey orchards."

LINNEAN SOCIETY.—At the evening meeting to be held on March 2, 1893, at 8 P.M., the following papers will be read:—"On the Flora of the Eastern Coast of the Malay Peninsula," by H. N. RIDLEY, F.L.S.; "On the Behring Sea Islands and their Flora," by J. M. MACOUN.

—— At the meeting held on Thursday, Feb. 16, Professor STEWART, President, in the chair, Mr. R. SPRUCE was elected an Associate of the Society. Mr. CLEMENT REID exhibited, and gave an account of some seeds of Paradoxocarpus carinatus, an extinct Pliocene and Pleistocene plant from the Cromer fossil bed. Mr. REID also exhibited and described some examples of Potamogeton hedonensis, a new type of pond-weed from the Oligocene strata of Hordle Cliff, in Hampshire. His remarks, which were listened to with great interest, were elucidated with the aid of diagrams, and were criticised by Mr. W. CARRUTHERS and others. Mr. J. E. HARTING exhibited some dried plants of a so-called Greek Tea (Sideritis Theezana, Boissier), which, during a recent visit to Thessaly, he had found to be extensively used there, as an infusion in lieu of Tea. He also exhibited some photographs of Thessalian scenery, showing the geological and botanical character of the country bordering the great plain of Larissa. Dr. OTTO STAPF pointed out on the map the scene of his botanical explorations in Persia, and gave some account of the flora of that region so far as has at present been ascertained. On behalf of Mr. C. B. PLOWRIGHT, a paper communicated by the President was read on the "Life History of the Æcidium on Paris quadrifolia." On behalf of Mr. J. C. WILLIS, M.A., who was unfortunately prevented by illness from attending, a paper was read entitled "Contributions to the Natural History of the Flower." This paper, the first of a series, dealt with the fertilisation by insects of plants belonging to the genera Claytonia, Phacelia and Monarda. Some observations on "British Worms," by the Rev. H. FRIEND, were read on his behalf by the Secretary.

THE ARAUCARIA IMBRICATA.—*Apropos* of a recent and interesting "obituary notice" of the earliest specimen of this tree introduced into this country, Mr. CHARLES HERRIN contributes a few corrections of, and additions to some notes that appeared in the *Daily Chronicle*. Mr. HERRIN points out that the historical specimen at Dropmore was presented to Lady GRENVILLE by King WILLIAM IV., and planted in the pinetum then being formed there. This tree has not obtained the height stated (i.e., 63 feet), being now only 50 feet high. The largest and handsomest specimen, some 69 feet in height, was, so our Conifer catalogue states, purchased at a sale in the Royal Horticultural Society's Chiswick gardens in the year 1829, and planted here 1830, so that the "persistent legend" of the stolen cutting cannot apply to this tree, which is allowed to be the finest in Great Britain. A third specimen, also planted in the year 1830, has the following history: Raised from a cutting taken from the plant in Kew Gardens, it got into the possession of Mr. KNIGHT, nurseryman, King's Road, Chelsea, and Lord GRENVILLE knowing this, sent his gardener to purchase it at any price, and gave ten guineas for it, a mere branch with a few roots. It is possible this might have been the "stolen specimen" referred to, but, if so, it is much smaller than the above-mentioned tree, being under 50 feet in height, and a somewhat poor specimen.

THE CURRANT-BUD MITE.—Although this insect has been repeatedly alluded to in our columns since 1869, and an illustration often given, yet many growers seem still unaware of the nature of the pest. The Board of Agriculture has now circulated a leaflet on the subject, from which we extract the following particulars relating to the modes of prevention and remedies:—"When Black Currant bushes are planted, they should be carefully examined for Phytopti. If there are any signs of unnaturally swollen buds, the young bush should not be planted. In taking cuttings in the late autumn, those from infested bushes must be rejected absolutely; infestation is easily seen then by the abnormal buds. Infested bushes should be cut very hard, and every particle of the cuttings carried away and burnt. In the spring, the bushes should be syringed well all over with a solution composed of 1 ounce of Paris Green to from 11 to 12 gallons of water, with 2 ounces of fine Wheat-flour added, or 2 ounces of soft-soap, to make the

olution adhere better. The Eclair 'Knapsack' pump ay be employed for this, and it must be impressed pon the labourers to direct the spray over every part f the Currant bushes. Another solution for spray-ng, to be used in a similar manner, may be com-osed of 5 to 6 lb. of soft-soap, mixed with the xtract of 8 or 9 lb. of Quassia chips to 100 gallons f water; 3 quarts of carbolic acid might be substi-uted for the Quassia. Spraying with these solu-ions should be repeated in the autumn, before the veather becomes cold, and just after the leaves have fallen, if possible. This will economise liquid and labour, and will affect the mites before they get into the buds. Directly the leaves have fallen, it would be desirable to put hot lime round the stocks, and dig it in at once, so as to bury the leaves with any mites that may be upon them, and thus prevent any chance of their getting up the stems. In very bad cases it would pay to cut the bushes close to the ground, and in the autumn and early spring to syringe the stocks with the Paris Green solution, or the carbolic acid solution. This would entail the loss of one year's crop only."

Veitch Memorial Fund.—The proposal of the Committee of this Fund to offer a Silver Medal for the best hybrid raised from two distinct species, and shown at the Ghent Quinquennial, has been received with much favour. This exhibition is likely to be an unprecedented success. For instance, one orchidist alone has assured us that he will stage 600 Orchids. The Council of the Société Royale d'Agriculture et de Botanique de Ghent is hastily preparing conservatories, the walls of which will be hung with draperies and mirrors; there will be a large collection of works of Art of every kind. The flower *de luxe* will be exhibited in such a case as shall fitly display its beauty.

The Orchidéenne.—Meeting of the Brussels Orchidéenne on February 12. A very interesting meeting where many excellent Orchids where shown. We will mention the principal:—1. Odontoglossum crispum leopardinum to M. G. Warocqué (Diploma d'Honneur de 1re classe par acclamation, and with congratulations from the jury); flower excellent, habit very good, sepals marked with three wide brown marks on a creamy-white ground, petals with dentated edges, covered with small brown spots arranged irregularly in lines to right and left, a large spot of the same colour in the centre, flowers united in a fine cluster. 2. Lælia Owenii, to M. G. D. Owen (also a 1st class Diploma par acclamation), an exceptionally good Orchid, hyb. nat. (?), from L. elegans, by L. Perrini, the lip is that of the latter, very pure white, the general colouring that of elegans; claret colour and of a beautiful velvety texture. 3. Cypripedium Claudii×, to M. Moens (1st class Diploma), a hybrid shown at the last Ghent meeting, and already described in our report. 4. Maxillaria triloris, to M. Kegeljan, a specimen plant with forty nice blooms (1st class Cultural Certificate par acclamation). 5. Cattleya Trianæ var. Madame Marie Louise, to M. le Comte de Bousies (Certificat à l'unanimité), with fulness of petals. 6. Lælia anceps Ballantineana, to M. Linden, a white variety, with splendid flowers. Two new Cypripediums: a hybrid from from M. Ch. Vuylsteke, from C. Leeanum superbum, by C. hirsutissimum, a valuable acquisition; the other, a hybrid from C. Spicerianum, by C. Harrisianum, a very elegant flower. Cultural Certificates were awarded for Dendrobium Ainsworthi, Lycaste gigantea, and Dendrochilum glumaceum (the latter bore sixty blooms), to M. Linden. First-class Certificates of Merit for Cochlioda Noetzliana, to M. de Moerloose; Odontoglossum nebulosum candidissi

Fig. 33.—Wistaria sinensis in Japan. (see p. 232.)

mum, and Odontoglossum Cervantesi var. to Dr Capart; Cattleya Trianæ var., Cypripedium Lathamianum var. Lindeni, Masdevallia Harryana (Kegeljani), Dendrobium superbiens, and Saccolabium bellinum, to M. Linden; Cypripedium Argus Moensi, to M. Cahuzac; Phajus tuberculosus and Cœlogyne cristata alba, to M. A. Van Imshoot.

International Fruit Show, 1893.—A meeting of the Provisional Committee took place at Anderton's Hotel, Fleet Street, on the 20th inst., H. R. Williams, Esq., in the chair; present also, Sir James Whitehead, Bart., M.P., Messrs. T. B. Haywood, P. Crowley, J. Wright, J. Laing, G. Gordon, &c. The matter of proceeding with the exhibition was discussed; eventually it was proposed by Mr. J. Wright, seconded by Mr. T. B. Haywood, and carried unanimously, that, having regard to the difficulties experienced in obtaining the site on the Thames Embankment, and also considering the number of exhibitions announced to be held in London during the coming summer and autumn, it is inadvisable to proceed with the proposed International Fruit Exhibition this year.

Phaius tuberculosus is flowering nicely in the Orchid-house at Kew (see fig. 35, p. 237). This is a most beautiful Orchid, and if it were only as easy to manage as the useful old P. grandifolius, it would deserve to rank with the very best of tropical Orchids. The Kew plant came originally from Sir Trevor Lawrence, and it was brought by his clever grower, the late Mr. Spyers, who, by the way, was once a young gardener at Kew. Spyers said he found the safest course to follow with this Phaius, was to plant it against a pad of sphagnum on a piece of Fern stem, water it abundantly, keep it always in the warmest corner of the stove, and every week to cover it with a large bell glass, light a pipe of tobacco, and blow a few whiffs of smoke into the glass—this kept down the destructive little yellow thrips. We have followed his directions at Kew, and have flowered this Phaius several times. The spike now on the Kew plant is a foot high, and it bears seven flowers. *W. W.*

Odontoglossum Cervantesi var. punctatissima.—A charming variety, new in bloom in the houses of M. Peeters of Brussels. All the parts of the flower, including the lip, are quite covered with rose-coloured dots; the lip is rosy-lilac, the sepals and petals the same colour, but paler.

Restrepia antennifera.—M. Peeters of Brussels has a specimen of this Orchid measuring 23½ inches across, and bearing about 300 excellent blooms.

Crotalaria longirostrata is a useful winter-flowering plant for the greenhouse. It forms a shrub about 1 yard high, branching freely if the points of the shoots are pinched out in the growing season, and clothed with light green trifoliate leaves, not unlike those of Goodia latifolia, but larger. The flowers are borne on terminal spikes 6 inches long, the upper half clothed with large yellow Laburnum-like blooms, which last a considerable time. At Kew it is grown in a warm greenhouse, except during summer, when it is placed outside in full sunshine. It grows very freely, is easily propagated from cuttings, and the old plants, if cut back in spring, soon form nice specimens. Unfortunately the fogs of winter damage the leaves and destroy the flower-buds, otherwise it would have been in bloom from November until now. The Sun-hemp, C. juncea, an annual species, is also grown at Kew for its long spikes of large handsome yellow flowers. There are very few of the 300 or so species of Crotalaria that are of known value in English horticulture, though many of them are spoken highly of as plants for tropical gardens.

Manchester Orchid Show.—We have now received the programme of the great exhibition to be held in the Botanic Garden from May 19 to May 25 inclusive. We are sorry to see that the latter day is also the first day of the Temple Show, so that the two will overlap. There are twenty classes, and the numerous prizes range in amount from £30 down to £2.

The Royal Gardeners' Orphan Fund.—We learn with satisfaction that Her Majesty the Queen has been pleased to command that the Gardeners' Orphan Fund (which was instituted in 1887 as a memorial of Her Majesty's Jubilee) shall in future be called by the above title.

Professor Pasquale.—We regret to announce the death of Cav. Giuseppe Antonio Pasquale, Professor of Botany in the University of Naples, and Director of the Botanic Garden of that city. He died on the 14th inst.

Ernst Benary.—The announcement of the death of the well-known seedsman of Erfurt, will be received with regret by all who had the pleasure of knowing him. By his sterling qualities as a man of business, and his amiability as a friend, he was generally respected and beloved by all with whom he came in contact. This was evidenced not long since when, on the occasion of his seventieth birthday, on November 10, 1889, he was, amongst other things presented with an album quite unique of its kind, containing the portraits of upwards of 500 of the principal seed merchants and horticulturists of the civilised world. This gift came to Herr Ernst Benary both as a great surprise and inexpressible pleasure; and in all probability he was the possessor of a gallery of portraits no other horticulturist past or present has, or can possess. To each donor of his portrait for this album, Herr Benary sent a highly-finished cabinet portrait of himself, as a souvenir of the interesting gift made by his sons, as well as the celebration of the fiftieth year of his connection with the Erfurt business. Ernst Benary died on the 19th inst.

Frozen Flowers from New Zealand.—On Friday, February 24, there was an exhibition at the Ipswich Fine Arts Club of flowers grown within 12 miles of Wellington. These flowers were procured by Mr. E. Herbert Fison, of Ipswich, a director of the Bank of New Zealand, preserved in ice, and were placed by him at the disposal of the Ipswich Scientific Society. The flowers were almost all those of European garden plants. It would have been much more interesting to have sent New Zealand flowers. New Zealand has flowers which are fit rivals to any the world produces, and yet we see that, as in other colonies, Chrysanthemums and other European fancies are preferred at flower-shows. That is a matter of taste; but when our colonial friends send flowers to this country, they would do well to remember that native flowers would be more novel and more appreciated. Alas! the beauty of the flowers fades as the ice melts—fit subject for the moralist. A Dendrobium we saw lately at Messrs. Sanders', presented but a sorry spectacle, even though the ice was only partially melted.

English Botany.—The first three parts of the supplement to English Botany, prepared by Mr. N. E. Brown, are before us. They have been compiled with much conscientiousness by Mr. Brown, and the figures are very accurate. British specialists, however, will look with little favour on an editor who owns that he has never attempted to study the endless forms of Brambles and Roses. As no two observers agree, it is rather comforting than otherwise to find Mr. Brown, although so well equipped naturally for the task, expressing no opinion. It is very useful to have a summary prepared by such competent hands. The Carisbrooke White Beam (Pyrus intermedia) seems to us to be planted, whether it occurs wild in the neighbourhood we do not know. Scabiosa atropurpurea at Folkestone has evidently been introduced by the upsetting of a barrow of garden-rubbish, or a similar cause. The work will be continued by Mr. Arthur Bennett.

Plants to be Introduced.—Ixora siphonantha.—This is a magnificent species, described and figured by Prof. Oliver in the last number of Hooker's *Icones Plantarum*, tab. 2236. The species is a native of northern Madagascar, with long narrow glabrous leaves and terminal heads of yellow flowers, each 8 to 10 inches long, with a very long and slender tube dividing into four spreading lanceolate lobes. Clerodendron Baronianum of Oliver in Hooker's *Icones Plantarum*, t. 2237, and C. eucalycinum, t. 2238, both from northern Madagascar, are both well worthy of introduction. Pleurospermum Franchetianum, of Hemsley, is a noble Umbellifer from West Szechuen, described as very showy, a statement borne out by the figure, t. 2244.

Coltsfoot.—The first flower was observed in West Middlesex on February 13. In previous years the dates were March 9, 1889; January 24, 1890; February 15, 1891; February 10, 1892. The earliest date recorded is January 24, the latest March 11. The average date at fifty stations for ten years is, according to Rev. T. A. Preston, March 1.

Pyrus coronaria.—We take the following from *Garden and Forest*:—Under the name of Pyrus angustifolia flore-pleno, there is figured, in a recent issue of the *Gardeners' Chronicle*, the double-flowered American Crab, which appeared a few years ago in a nursery in the Western States, and which is really a form of P. coronaria; the Northern Crab, P. angustifolia being confined to the Southern States. This double-flowered Apple tree is one of the best among the recent introductions of hardy plants, and it should be more often seen than it is in our gardens.

Johnson's "Gardeners' Dictionary."—Messrs. Bell announce an entirely new edition of this useful work, which has been before the public for forty-seven years, and is now being thoroughly revised by Mr. C. H. Wright and Mr. D. Dewar. It will be issued in eight monthly parts at 1*s.* each, commencing on March 1.

The Wolverhampton Horticultural Society.—The schedule of prizes for the next exhibition of the society in the public park in July next has just been issued, and is of a very liberal character. With £20 as a 1st prize for sixteen stove and greenhouse plants, £15 for a group, £12 10*s.* for seventy-two Roses, £6 for forty-eight Roses, £7 10*s.* for a collection of fruit, and other large 1st prizes for other things, backed up by large other prizes, a fine exhibition must reward the efforts of the committee. There is a class for old-fashioned garden Roses in bunches; and last year two interesting exhibits of these old garden favourites were much admired.

Birmingham Gardeners' Association.—At the last meeting Mr. W. B. Latham, Curator of the Birmingham Botanical Gardens, brought under notice, in an excellent paper on stove and greenhouse climbers, some of our comparatively little-known but beautiful climbers, now so seldom seen, and gave cultural instructions for each. This paper will be the means of bringing these plants into more general notice in the Midlands, as a large number of gardeners were present.

Tadcaster Paxton Society.—At a meeting of the above Society, held on Thursday evening, February 16, Mr. Bromet in the chair, a paper was read by Mr. Clayton, gardener at Grimston Park, on "Allotment Gardens," in which the essayist pointed out the benefit, not only profitable but social and physical, derived therefrom by the holders. A discussion followed, in which many of those present joined. A hearty vote of thanks was accorded Mr. Clayton for his excellent paper.

Scottish Horticultural Association.—We have before us the preliminary list of the Chrysanthemum exhibition to be held in Edinburgh on November 16 and two following days, from which we gather that the various prizes offered may be competed for by all British and foreign growers complying with the regulations, unless otherwise specified. The prizes for plants seem to be very good

ones, both in the gardeners' and amateurs' classes, as are those for cut blooms of Chrysanthemums. The City of Edinburgh offers a cup, value £20, and four other prizes for the best forty-eight cut blooms of thirty-six Japanese varieties; the Scottish Challenge Cup and £5, besides money prizes to the number of three, are offered to Scottish gardeners and amateurs for the best thirty-six Japanese in twenty-four varieties. There are a ladies' class, an amateurs' class, one for growers for market, and one exclusively for nurserymen, so that everyone's case is fairly met by the schedule. Various competitions in plants, fruits, and vegetables will still further add to the general attractiveness and interest of this exhibition.

Sunderland Gardeners' Society Annual Dinner.—The annual dinner of the members of the Sunderland and District Gardeners' Mutual Improvement Society was held in the evening of February 15, at the Palatine Hotel, Borough Road. The society has just entered upon its third year, and during its existence has been of great assistance to members. The president of the society (Ald. Shadforth) occupied the chair, and Mr. H. Ritson, a vice-president, the vice-chair. Others present were Messrs. C. Errington, Higgs, Hall, Cobb, Webster, Johnson, Whitely, Richardson, Walton, Vosper, J. Watson, Gibson, Archer, Bailey, Thursfield, Wakelyn, Falconbridge, Metcalf, and T. W. Bolam, F.R.H.S., chairman of the society. An excellent repast was partaken of by about sixty members and friends.

Old Trafford Gardens.—Mr. F. E. Weiss, Professor of Botany at Owens College, began a series of twenty lectures on botany at the Botanical Gardens, Old Trafford, yesterday afternoon. The lectures are under the auspices of the Lancashire County Council, and are intended mainly for gardeners. There was a good attendance, and Mr. Bruce Findlay introduced the lecturer.

Cymbidium grandiflorum, Griffith.—The plant of this beautiful species, better known in gardens as C. Hookerianum, which was awarded a First-class Certificate at the last meeting of the Orchid Committee of the Royal Horticultural Society, was offered for the owners, Messrs. Ross & Co., nurserymen, of Merstham, by Messrs. Protheroe & Morris, at their Great Rooms in Cheapside, on Friday, February 17. After a spirited competition, in which several of the leading growers took part, it was secured by Messrs. James Veitch & Son, of the Royal Exotic Nursery, King's Road, Chelsea, for fifty-four guineas.

Bournemouth and District Gardeners' Association.—At the last meeting of this association on Wednesday, February 15, Mr. J. Spong, gardener to Lady Cairns, read an interesting paper on Dendrobium nobile, of which plant Mr. Spong is a very successful cultivator. The reading of the paper was followed by an animated discussion on pruning the Dendrobe, Mr. Spong being strongly in favour of the practice.

National Carnation and Picotee Society.—We have before us the annual report of the Southern Section, evincing continued progress. A list of the kinds considered best for general cultivation in each section is given. The Hon. Secretary is Mr. James Douglas, Barking Side, Ilford. The next exhibition will be held in connection with the meeting of the Royal Horticultural Society on July 26, 1893. The number and value of the prizes offered has been greatly increased.

National Auricula and Primula Society.—The sixteenth annual report testifies to an increasing interest in these plants, notably the show and alpine Auriculas. The report contains a list of the best varieties in each section, which will be useful to growers and exhibitors. The next meeting will be held in connection with the Royal Horticultural Society meeting on April 25. The Hon. Secretary is Mr. James Douglas, Barking Side, Ilford, E.

Lilies.—The *Garden* of January 21 has a translation of M. Franchet's paper on "Chinese Lilies," which will be found of great interest. Mr. Elwes, at the St. Petersburg Congress of 1884, expressed the opinion that many species would eventually be found in the mountains of Western China, and this forecast has been verified, for there are now twenty-four species of Lilies known as occurring in China and the Tibetan frontier, fourteen of which occur only in the provinces of Yunnam and Setchuan, in the very region which Mr. Elwes indicated. M. Franchet alludes to the great differences that cultivation brings about, and remarks that it is almost impossible to recognise a wild Lilium japonicum from the plates in the horticultural journals, or even in Mr. Elwes' *Monograph*. M. Franchet points out some additional points of distinction between the species and which are not so open to variation, according to circumstances, as the form of the perianth, and of its segments; for instance, the presence or absence of papillose hairs on the stamens, and the characters afforded by the furrow at the base of the segments. The new species as described by M. Franchet in the *Journal de Botanique* are L. myriophyllum, yunnanense, Delavayi, Duchartrei, papilliferum, lankongense, Fargesii, setchuense, taliense, ochraceum (?).

"Bibliografia de la Rosa."—Under this title D. Mariano Vergara, of Madrid, has published a list of periodicals, books, pamphlets, and trade catalogues, published in various countries, and relating to the Rose, as well as of the principal Rose societies. It is printed on one side of the page only, the other side being reserved for any "observaciones" that may occur to the reader. The list is not altogether without value, but it must not be accepted without caution. The omissions are sometimes serious: thus, no mention is made of the Rose Congress, at Chiswick, in July, 1889, decidedly the most instructive Rose exhibition ever held; nor of the report of the Congress, which contains a larger amount of substantial information concerning the Rose than is comprised in any equal number of pages. The list of catalogues given under the head of Inglaterra, is woefully incomplete, only eight names being entered; whilst Scotland and Ireland are even worse treated (it is not the base Saxon this time!), for they are not mentioned at all. Under the heading of Sociedades, the titles of some very few of the schedules of various provincial societies are cited. Of what interest these can be to Spanish rosarians, it is difficult to understand. Here, for instance, are a few extracts which may serve to amuse the reader, but which can otherwise have no substantial value.

"Bagshot, Wednesday, July 3, 1889.—Exhibition of cut Roses. (In affiliation with the National Rose Society). En 4° mayor, 4 paginas."

"Canterbury and Kent Rose Society, 1889, en folio, 4 paginas en papel de color de rosa."

"The second annual show of the Dursley Rose Society, (Wich (*sic*) has been affiliated with the National Rose Society) will be held in the cricket-field, Dursley, &c. Dursley por Bailey en folio, 4 paginas en papel de color de rosa."

"1889. Please keep this schedule. Nineteenth exhibition of the Farnham Amateur Rose and Horticultural Association. En folio, 4 paginas."

It may be that some collectors of Rosarian literature may desire to place this book upon their shelves as a "curio," or may be desirous to assist the author in the revision of a new edition; it may, therefore, be useful to add the address of the author, D. Mariano Vergara, Plaza de Santa, Barbara, Madrid.

Influence of Fungi on Flowers.—It is a curious but now well-ascertained fact, that the presence of a parasitic fungus may cause a stamen, which is usually abortive, to assume its normal growth and function. Thus the ordinarily barren staminal rudiments in the female flower of Lychnis diurna, may become fertile under the influence of the parasite. M. Ant. Magnin has now examined the forms of flower met with in Hyacinthus comosus—in some, the staminal rudiments are visible to the naked eye, and the more or less atrophied pollen may be seen by the aid of a glass. In other flowers there is no trace to be seen of stamens, and between the two extremes there is every intermediate condition. The Ustilago does not attack the perfectly-formed flowers in this case, but those in which there are usually rudimentary stamens only, and these rudiments are stimulated into growth by the fungus. An inverse state of things occurs in the case of the female flower. The rudimentary female flower under the influence of the parasite takes on growth, develops the ovary but no perfect ovule.

CATTLEYA LABIATA.

This magnificent Orchid was originally introduced from the immediate neighbourhood of Rio de Janeiro by Mr. William Swainson, and flowered for the first time in Europe in the stove of W. Cattley, Esq., of Barnet, during November, 1818. It was described and figured by Lindley in his *Collectanea Botanica*, the genus being dedicated to Mr. Cattley. Thus, it is the original species of the genus, though the Epidendrum violaceum of Loddiges was added, as a second species, at the same time. In 1819 it flowered in the Glasgow Botanic Garden, and again in November, 1824, when a coloured plate was prepared for the *Exotic Flora*, from which work we learn that this very plant was an offset from Mr. Cattley's parent plant. The precise locality where it was collected was not stated, but two facts are known, which are sufficiently conclusive. One is, that Swainson's collections were made in the immediate neighbourhood of Rio; the other, that until as late (at least) as 1836, the plant grew wild in two localities within fifteen miles of that city. These were the Gavea, or top-sail mountain, where it grew on precipitous cliffs, at several hundred feet elevation; and the Pedra Bonita Mountain, immediately opposite the Gavea, on the edge of a precipice on the eastern side. Here Gardner met with it in full flower in November, 1836, and secured specimens for drying and also abundance of living plants. The former were distributed, and good specimens exist both at Kew and in the British Museum. The latter I have not been able to trace, though it seems probable they were despatched to Europe, for Gardner sent home some living plants, one being the Cattleya intermedia variegata of Hooker (really C. Harrisoniana of Bateman), figured in the *Botanical Magazine*, t. 4085, in 1844. Until about this time, however, it appears to have been fairly common in such collections as then existed, for in 1838, we read in Paxton's *Magazine of Botany*, that "plants may be had from Messrs. Loddiges, Rollison, or Knight, at a reasonable cost." I believe all the plants imported up to the date in question came from this locality, close to Rio. After it was exterminated there, it soon became excessively rare in cultivation, doubtless owing to the fact that the cultivation of Cattleyas was then very imperfectly understood, and many of the plants did not long survive the treatment they received. The circumstances attending its extermination can readily be understood from what has been placed on record by Gardner. Only a year after he first met with it, he again visited the spot, and found that a great change had taken place. The forest had been cut down, and converted into charcoal, and the small shrubs, &c., destroyed by fire. "The progress of cultivation," he remarks, "is proceeding so rapidly for 20 miles around Rio, that many of the species that still exist will, in the course of a few years, be completely annihilated, and the botanists of future times will look in vain for the plants collected by their predecessors." Gardner also records finding Cattleya labiata on the banks of the Rio Parahyba, which forms the boundary of the provinces of Rio de Janeiro and Minaes Geraes, flowering in March. This has been supposed to be the variety Warneri, though I do not

see why no specimen was preserved. Even here Gardner records that square leagues of the forest were being cut down or burnt, in order to make room for plantations of Coffee. We now come to the period of its re-introduction, for there is a gap of about forty years, during which many expeditions were sent in search of the plant, and as all proved unsuccessful, it was feared that it had become extinct. In 1882, a small batch of plants was received by Mr. Bartlett, the curator of the Zoological Gardens, London, which he disposed of to Mr. B. S. Williams, of Upper Holloway. In 1889 M. E. Moreau, of Paris, received a small importation from some part of Brazil. The following year Messrs. Linden, of Brussels, imported a Cattleya from Brazil, which they distributed under the name of C. Warocqueana, but which was proved to be C. labiata. During the present autumn (1892) it has been imported in bulk by Messrs. F. Sander & Co., of St. Albans, who had despatched a collector some months previously in search of the long-lost plant. Viewed in the light of recent events, it is, indeed, remarkable that it should so long have eluded the different collectors who have been in search of it. It is now clear that the species was formerly more widely diffused than at present, and that the locality close to Rio, whence the earlier specimens were obtained, was an outlying station. When it was exterminated in this locality by the burning of the forest for Coffee planting, and cultivation generally, it soon became excessively rare in European collections. Recent importations have also proved it to be very variable, but a comparison of old figures shows that this is not at all a new feature of the species." *R. A. Rolfe in "Reichenbachia," t.* 49.

New Invention.

WOODS' PLANT CLUB LABEL.

It is claimed for this label that it is practically imperishable. The material is wholly zinc, in one piece. The principle and the material have been under test fifteen years, and the labels are good and distinct to-day.

The concavity in the stem and at the head afford strength, and when pushed in the ground, the three angles in the stem are capable of securing firmness and fixity of the label against wind, frost, and animals. Owing to the ample length of stem, the label may, if desired, be kept raised fairly well from the soil; but when it is desired that the label should be less conspicuous, it may be pushed down to the neck of the name-plate, It is important that a standard quality of the metallic ink should be employed for writing these labels, which is specially provided for them, being much stronger than that usually supplied for zinc label writing.

It is expected that the present size in which the label is made, the name-plate being $2\frac{3}{4}$ by $1\frac{1}{2}$ inch, will be too small for some purposes, and too large for others; but it is suggested that when the labels are only required for special reference, they may be pushed well down, or even placed behind, rather than in front of the plants, where it would hardly be seen until sought.

It would almost seem that a strong and durable label could not be expected for less than a penny each, at which the present one is provided. The designer of this label has had the advantage of not only seeing the dozens of various labels, as used by his numerous garden friends, but he has had the advantage of seeing them *in situ*, and of the information and experience of their owners. Many of such labels are good for their respective uses, but in the case of the present label, it has been sought to incorporate all the advantages, and at the same time to provide a label durable, neat, and at a reasonable price. It could hardly be expected that a lifetime label could be written quite as quickly as a wooden tally, though it is nearly the case with this label, when the materials are kept handy.

It is very common for labels to be trodden down and so lost, but owing to the length and shape of this one, the chances would be very slight of such loss. Something might be said on the matter of quality of zinc, but suffice it to say, that after many experiments with different brands a quality has been pitched upon for these labels which gives off a minimum quantity of exudation. This favours the clearness of the black lettering on the imperishable property of the whole label.

Nursery Notes.

CHILWELL NURSERIES, NOTTINGHAM.

Messrs. J. & R. Pearson & Sons have a high reputation, and the long period the firm has existed, the condition of their extensive establishment, and the high state of culture presented, bespeak pleasant and profitable relations with their numerous customers, both home and foreign. Of course, during the many years of its life, the nurseries have had to make changes in the matter of specialties, in order

Fig. 34.—Woods' patent zinc label.

to keep up with the times, and it has probably been owing to the aptness with which these have been made that the vitality and up-to-date character of the concern has been maintained.

In the time of the late Mr. J. R. Pearson, who was an enthusiast in all that he took in hand, and who followed some of his hobbies with all an amateur's liberality, the raising of new zonal Pelargoniums was a great feature of the place, and some of the best of their day came out at Chilwell, and even now the raising of new varieties of these plants is continued by them with undiminished success; so also with Vines in pots, for which these nurseries have always been noted, and the growth of which accounts for the large and lofty dimensions of many of the glass structures. Of late years, Chrysanthemums have been largely and well-grown by Messrs. Pearson, their large orchard-house, in which are still the remains of what has been one of the chief floral attractions of the Midland Counties, being evidence of the fact. For the general stock and the show plants for next season, a propagating-house is entirely filled with cuttings in single pots, of all the best varieties. Starting on a tour of inspection of the main block ef houses, consisting of twelve or thirteen structures, each 100 feet in length, and varying in width up to 25 feet. In the first were found a grand display of a very fine strain of Cinerarias, some fine specimens of Cœlogyne cristata, Freesias, the pretty pink-flowered Rogeria gratissima, and other greenhouse plants. In the second house entered, one of the finest batches of the Chatsworth variety of Cœlogyne cristata we have ever seen, extending along the whole side of the house, and bearing a profusion of bloom, the vigour of the plants accounting for eight flowers being found on many of the spikes. In this house, a batch of Cymbidium eburneum was finely bloomed; a number of Dendrobium nobile, grown up to their best; Oncidium flexuosum (a great favourite for cutting), very strongly grown, and sending up flower-spikes very profusely; and lesser batches of Cypripedium Chamberlainianum, Miltonia vexillaria, Zygopetalum Mackayii, and other Orchids, as well as a healthy lot of Kentias of a useful size. A collection of Orchids is not attempted at Chilwell, but good showy species of use for cutting purposes are well grown there, the cool lean-to Odontoglossum-house affording a good instance of successful Orchid culture. It is filled mainly with good large plants of O. crispum and O. Pescatorei, which are sending up spikes freely, the smaller division having already a good show of O. Rossii majus, with a plant or two of Sophronitis violacea and other species. The next, a warm range, is on one side furnished with grand plants of Tabernæmontana coronaria flore-pleno, some 3 or 4 feet in height, bushy, leafy, and covered with bunches of pure white flowers, and very different from the scraggy plants often seen of it in gardens. With them is a fine lot of Gardenias in bud, a well-grown selection of Crotons for table decoration, a small lot of Dendrobium Phalænopsis Schroderianum, D. bigibbum, and D. Dearei, all plants with very stout growth.

Next, we come to a large and lofty vinery, built twenty-eight years ago, but still in a good state of preservation; here, beneath the Vines, are grown Maidenhair Ferns and double white Primulas, as well as a batch of the useful Asplenium Colensoi, the fragrant Boronia megastigma, &c. Then follows a house of Pelargoniums, with Ivy-leaved Pelargoniums forming arches at intervals along its whole length; then the Chrysanthemum show-house before alluded to, and next a greenhouse, in which, among other things, is a very large stock of Yucca filamentosa variegata — some thousands of plants— a charming plant tolerably hardy and beautiful in flower and leaf. A house of Tea Roses and Clematis comes next, and then a very large warm house, down one side of which numerous plants of Eucharis grandiflora are giving a fine supply of flowers. In this house the whole roof is covered with Stephanotis grandiflora, and its stages are used for bringing on a fine supply of flowers of Azalea indica alba, Lilium Harrisii, and other plants for forcing. Here, and in several of the other houses, are large quantities of the red-berried Ardisia crenulata, which some growers have abandoned on account of the three years necessary for the plants to fruit and be fit for sale; but as they last a considerable time, either in a greenhouse or dwelling-house, when they are fit, they are well worth waiting for.

The next large house, 100 feet by 25 feet, has a singular feature in it, in the matter of a dividing wall put down one side from end to end by the late Mr. J. R. Pearson, in order to provide a shady house (practically a lean-to) in which to grow and prove his summer Pelargoniums. It answered admirably, and is at the present time filled with new seedlings, which will be tested this year. The back wall of this house is densely covered with the growths of Asparagus plumosus, from which a cartload of foliage could well be cut without it being missed.

Among the other items we found a quantity of Carnations in a structure originally built for raising seedling Rhododendrons, a houseful of Cytisus and double white Primulas, several houses full of Tea Roses, Maréchal Niel being especially fine; an orchard-house, 90 feet by 20 feet, furnished with Peaches, Nectarines, &c.; a large house of similar size, in which an immense quantity of Vine-eyes are being struck; a fine Camellia-house, well furnished

with double white-flowered Camellias, and a large plant of the now rare single white with its golden anthers, and which many would prefer to the double variety. Then we come to several propagating houses devoted to the propagation of Roses, Clematis, or whatever it may be desired to increase, and passing the bouquet-room, the fruit-room, in which the fruits of Newton Wonder Apple were observed as beautiful and sound as in the autumn, the garden with its magnificent clumps of Rhododendrons is crossed, and the oldest house on the place is reached. It is a curiosity in its way, built partly of wood, with iron rafters, wall plates, &c., some seventy years ago. The house is still sound. Its roof was formerly covered by a Vine, which entered the house through a hole made for it in the hard stone coping, some 9 inches thick, but so irresistible was the gradual pressure of the thickening stem, that after it had filled the space allotted to it, it split the coping. A pretty rockery is outside this house, and near at hand, are the offices, seed and bulb warehouse, packing-sheds, &c., the whole being kept in proper order.

The Fruit Tree Nurseries have received steadily increasing attention at Chilwell for many past years, and notwithstanding the fact that an area of 50 or 60 acres is occupied by a capital stock of trees, among the whole of which not a single instance of canker or blemish of any sort is to be met with; 5 or 6 acres have to be added annually, for despite the increasing numbers grown, Messrs. Pearson find the area under fruit inadequate to meet the demand, especially in varieties of Apples, which the better knowledge of recent time have brought greatly into notice. In their fruit culture, Messrs. Pearson begin at the beginning by growing large quantities of their own special stocks, the Paradise Stock, so largely used by them for pyramid Apples, which they deem the trees of the future, having been, after comparative tests, selected as the best by the late Mr. J. R. Pearson over forty years ago, and the firm have always propagated largely, and worked on this stock with the best results, for on it the trees are found to make plenty of fibrous root, and to grow in the exact proportion of vigour necessary to favour early cropping. So also with the Quince stocks for Pears; it is alleged that the Chilwell stock of properly-cultivated Quince when worked will produce trees that commence to fruit when no larger than a good-sized Gooseberry bush—a direct contradiction of the old proverb, "He who plants Pears, plants for his heirs."

Coming to the general stock, we find that Messrs. Pearson have cast aside all doubtful or inferior varieties of all sorts of fruits, and grow only the best. Beyond this, they recommend the planting of a few kinds only in each district, the kinds planted being those which are known to do well; and further, it is found that the selection must be varied according to the soil and climatic peculiarities of the district intended to be planted, and on all these matters, having made a special study of the subject, they are willing, nay, anxious to give advice. Some of the Apples, either new or worthy varieties, which they are cultivating largely, are Newton Wonder, sent out by J. and R. Pearson & Son, one of the finest and longest-keeping kitchen Apples introduced; Gascoyne's Scarlet Seedling, Bismarck, Beauty of Bath, Chelmsford Wonder, King of Tomkin's County, Lady Sudeley, Peter the Great, Royal Jubilee, and Prince Albert, as well as such favourites as Ecklinville, Russian, or Duchess of Oldenburg; Cox's Pomona, Cox's Orange Pippin, Blenheim Orange, King of the Pippins, New Northern Greening, Ribston Pippin, Warner's King, &c. Passing to the main fruit nursery of over 25 acres, which, like the rest of the ground, is staked out in quarter-acre pieces, the readier to compute work done, we find some 30,000 one, two, and three-year-old Apples on Paradise stocks, and some 20,000 on Crab stocks, with proportionate quantities of Pears; some 10,000 dwarf-trained of both Apples and Pears, a lesser quantity of cordons, &c. One great and costly feature is that all the things are staked, some 40,000 short and 70,000 long stakes having been used, it is said, last year. Of course, the better rooting of the trees warrant it, but it is a matter which many fruit tree growers shirk as much as possible. Next we come to a fine lot of Plums, which are here from the earliest stage horizontally trained, as it is found that when so treated they have not that tendency to run up when planted. Further on, is a grand lot of trees of the old Shropshire Damson, three years old; another of Cherries, and so on throughout this and the newer piece of 15 acres, and the lesser pieces all are filled with grand stock—clean, straight, and well furnished. Passing to the old fruit garden, which is interesting by reason of a wall a mile and a quarter long running round it, and built in a very ingenious manner by direction of the late Mr. Pearson. It is of a single course of brick, and in order to give it strength is built in recesses, i.e., the wall in 10-yard lengths, with 1 yard deep set-off continued round the whole of the ground. This wall is planted with Peaches, Nectarines, Apricots, &c., and in the nursery itself is kept the old proved trees of any kinds which may be wanted for

FIG. 35.—PHAIUS TUBERCULOSUS. (SEE P. 234.)

propagation in limited quantity at any time. Beyond these there are lesser pieces for bush fruits, but despite the large and fine stock, Messrs. Pearson still intend to increase, for, as they justly remark, if persons who have worthless trees or unprofitable kinds could be induced to get rid of them, and plant such as we now know to be profitable, their stock of trees, together with those of kindred firms, would be but as a drop in the ocean, to say nothing of new plantations.

HOME CORRESPONDENCE.

SAGE.—The old lines alluded to on p. 208 of the last issue of *Gardeners' Chronicle*, are:

Cur moriatur homo, cui salvia crescit in horto?

but the answer,

Contra vim mortis, non est medicamen in hortis.

The Stockholm M.S., 1290, has

Also seyth Macrobius,
Averse yât is yûs,
Cur moriatur homo dû salvia crescit in horto.
"Why of seknesse deyeth man,
While Sage in gardyn he may han."

It is, of course, quoted in the *Schoole of Salerne*, and in Cowley's *Plantarum*, and probably in all the old herbalists who wrote on the virtues of plants. *H. Ellacombe, Bitton Vicarage.*

HARDINESS OF EUCALYPTUS COCCIFERA.—I entirely agree with your Tasmanian correspondent, Mr. MacPherson, p. 207, as to the desirabilty of Eucalyptus coccifera being further tried. I have mislaid the number of the *Gardeners' Chronicle* in which the original note appeared, but I think it was stated that, although the seeds were collected from trees encrusted at the time with snow and ice, the seedlings did not survive the winter at Kew. I cannot help thinking that had they been in a cold house during their first winter, they would have proved quite hardy when planted out. I have a tree at Loch Hourn Head, Inverness-shire, west coast, which was planted in 1885, when about a foot high. It has never been even touched by frost, although last winter was a severe one, the sea water being frozen over for 2 or 3 miles down the loch, and it is now (I am writing from memory) 10 or 12 feet high, and the trunk nearly 18 inches in circumference. Two or three small trees, planted in 1891, were much cut back during the winter, but when I left Scotland in November they were looking well. E. amygdalina, coreaiac, urnigera, and Gunni, planted as very small seedlings in 1891, also lived through the winter, though much cut by the severe frost. I only wish I knew where seed of E. coccifera is to be obtained, as I am very desirous to plant it more extensively, but I have been unable to procure seed either in England or France. Eucalyptus coccifera is a very handsome tree, not growing in the straggling way of E. globulus. I would like to mention what at least is a curious coincidence, with reference to the general belief in the efficacy of the oil of Eucalyptus as a safeguard against influenza; last winter, the only house in the district which did not suffer from a severe form of the prevailing epidemic was that of one of my keepers, within a few yards of the tree I have mentioned. I do not suggest that it was more than a coincidence, but at least it was a very marked one. *Robert Birkbeck, 20, Berkeley Square.*

—— With reference to the interesting communication upon the hardiness of Eucalyptus coccifera, which appears in your issue for Feb. 18, I would wish to remark that several years ago I had planted some young trees in the grounds of the Atkinson-Morley Convalescent Hospital at Wimbledon. They remained unharmed during many winters of great cold, until about two years ago a very heavy snowstorm occurred, which broke off several branches (I may observe that the trees had now attained a considerable height, say 12 to 15 feet), a severe frost supervened and penetrating the wound, caused by the fracture, proved fatal to all the trees. Had there been no lopping off, there would have been no death. Frost alone would not have killed them, for they had withstood several winters quite as severe but without snow. *John Colebrook.*

—— It may interest your readers to know that about five years ago I purchased a dozen very small plants of Eucalyptus coccifera, and planted them on the hill (at varying elevations) which rises immediately behind my sister's house, Wansfell Holme, Windermere. These plants (now trees, for they are from 15 to 20 feet high, as far as I can judge without actual measurement) have all withstood the severe frosts of these five winters, and only one has suffered serious injury. This one lost about 4 feet of its top in the winter of 1892, but broke back freely when the growing season came round again. I must just add that E. globulus has also been tried, but is much too tender to withstand our severe frosts. *O. O. Wrigley, Bridge Hall, Bury, Lancashire.*

GALANTHUS FOSTERI is a fine, showy, and distinct Snowdrop. We have here a nice lot of it coming into bloom at the present time. It gets bespattered with soil and sand when planted in cultivated ground in common with other Snowdrops, but I hope to have a considerable colony of it established in the grass by another year. Mr. Max Leichtlin kindly sent me last year a bulb of a very interesting and rare Galanthus from the Isle of Thasos. It is now in bloom, and is similar to G. Fosteri in the flower and markings on the cup. The leaves are broad, like those of G. Fosteri, but instead of being of a dark green like G. Fosteri, they are of a light green, more like the green of G. nivalis. *D. Melville.*

TREATMENT OF GOLD FISH.—In reply to your correspondent, Mr. M. E. Mills, the frequent washing of the gravel would obviously be inconsistent with my plan of non-disturbance from year's end to years' end. If, however, he is troubled with an abundant confervoid growth on the gravel, due presumably to strong light, it may be removed by means of a syphon, the short end of which if directed to any undesirable accumulation will at once suck it up and discharge it. I am not, however, in favour of sup-

pressing such growth, except where it obscures the view by covering the glass; inasmuch as it helps to oxydise the water, and favour animalcular life, upon which the fishes undoubtedly feed. Subdued light is probably the best cure, as my aquarium stands well away from the window upon a sideboard, and gives me no trouble of the sort described. The two fish have been eight years in the aquarium—a pretty fair proof of sound treatment. *Chas. T. Druery.*

PLUMBAGO CAPENSIS BEDDED-OUT.—At a recent meeting of the Birmingham Gardeners' Association, one of the members alluded to his having repeatedly seen Plumbago capensis planted out in four large beds, as a bedding-out plant, at Wilton House, near Salisbury. Strong established plants were used, pegging them down and planting Calceolaria amplexicaulis amongst them, and that he thought the Plumbago was still used there for that purpose, although it is thirty years since he was there. It will be interesting to know if any other of your readers have had experience of this plant for bedding-out purposes. *W. D.*

"TUFTED" PANSIES.—We are very glad to see the protest against such a misleading application, viz., to call Violas or Bedding Pansies by the name of "Tufted" Pansies. It is so misleading, that several of our lady customers and others told us that it was a new class of Pansies altogether, and that we did not have them. We concur in every word that Mr. Dean has said, and will stick to the name "Bedding Pansies and Violas." This includes all, excepting what we call Show and Fancy Pansies, so we hope we shall hear no more about "Tufted" Pansies. *James Cocker and Sons.*

—— You say, "We are puzzled to understand the application of the word 'tufted' to the bedding Violas. We are told that the term tufted has been used to distingnish plants of a spreading habit, like Pinks, Aubrietias, &c., from plants with simple erect stems, such as the Stock. To apply the term tufted to plants of a spreading habit is a complete contradiction of terms, &c. But in the employment of popular names there is no guide but custom and caprice." Among the plants to which botanists have applied the term, the most familiar, and one of the prettiest, is the dainty little Campanula cæspitosa, often used as an edging, and of which there is a good white as well as the ordinary bluish form. Now, the close or tufted habit is well shown in this plant, with its dense, close habit, so very different to many plants of the same genus, some of them even reaching 6 feet in height, and showing every degree of vigour and looseness of habit. Well, if this plant possessed a dozen lives, it could not increase more vigorously at the root, and spread, than it does, without losing its tufted habit; so that if one plants it as an edging in narrow walks, it will often meet in the middle, and leave no room for the feet between; while, if we take it up, a thousand plants may be made from one, owing to its spreading habit. I planted it near some flagstones, and have found it runs both over and under them. Take, again, a native plant less known in gardens, but not uncommon, the tufted Rockfoil (Saxifraga cæspitosa), which represents in the same way as the little Harebell did among its kind, the tufted habit of its great alpine family. Now, while always preserving their close tufted habit, these plants spread over the earth like magic. If the Saxifrages of the mossy section are dotted over beds or borders, they will soon close together, and give little chance to the annual weeds that infest most garden ground. If we take up a plant, we find innumerable rootlets already at work in the moist, close tuft, always pushing its gentle, but not very slow, way over the ground. Just in the same way as these two types of well-known plants show the tufted and spreading habit, so are the mountain Violets, V. calcarata, V. cornuta, and others which, while tufted in habit, spread at the same time at the root; this excellent character they have given to their garden progeny, the tufted Pansy—crosses between the alpine Violets and the newer garden forms of V. tricolor, or whatever the garden Pansies may have come from, a point on which good botanists are not agreed. What is beyond dispute is, that all these plants are hybrids and varieties, and, therefore, by the express wisdom of the scientific, allowed only to possess an English name. The term tufted is a true and good name in every way from a botanist's or gardening point of view, and gets rid of the never-ending confusion among gardeners in attempting to draw a distinction between Viola and Pansy, which is impossible and ridiculous. *E. J. L.*

PEACH-BUDS DROPPING.—From time to time during many years all sorts of reasons have been advanced to explain bud-dropping in Peaches, and many injurious theories have been laboriously built up and promulgated; but, so far as I have read, no one has been able to prescribe a cure for the complaint. I have forced Peaches extensively for the past twenty-four years, and I can assure your readers that for twelve years I have not had a bud drop, to my knowledge, and I am satisfied in my own mind that I have found a cure for the complaint. In a few words, it is this:—See that your borders are thoroughly well drained, and replant your trees periodically, adding some fresh loam, and a small quantity of bone-dust, and ¼-inch bones, at each time; the replanting should be done as early in the autumn as possible, which will be as soon as the trees are sufficiently ripe. Young trees up to six years old should be replanted every other year, and older trees every four years. Very old trees I do not lift entirely, but the roots within a few feet of the main stem are all taken up and relaid in new soil every six or seven years. When this work is systematically carried out, it is not at all so laborious a business as many would imagine, for the trees, by frequent lifting and the addition of virgin soil, form a solid mass of fibrous roots within a few feet of the stem of the tree, which are almost as easily and effectually fed and nourished as are trees in pots. I do not wish to imply that insufficient disbudding, and the consequent overcrowding of useless growth in summer may partially account for this complaint sometimes; but I am confident the mischief is at the roots, and I would strongly advise any gardeners who are troubled in this way, to take my advice, and replant their trees at frequent intervals, and I can promise them immunity from Peach-bud dropping for ever afterwards. Winter irrigation, with weak liquid-manure water, is also no doubt beneficial to Peach trees under glass, and especially so under this system of frequent lifting, as the mass of roots formed close to the tree are much nourished and benefited by a liberal application during the time the trees are seemingly at rest. Are the roots at rest in winter? I had occasion to take a tree up a few days ago which had been replanted early in the autumn, and found that it had made a large number of splendid white roots—was this winter root-growth the result of the replanting in the autumn?—or would the growth have taken place had the tree been left undisturbed? *O. T., F.*

MR. MEREDITH AND MUSCAT CHAMPION GRAPE.—The "late Mr. Meredith" (according to "Vagabond's" account), called here last week, and very pleased I was to see him, looking as well as ever. I put the question to him about the Muscat Champion. His reply was, "There is not a word of truth in it, for I never grew that variety." I know a copy of your issue of January 7 was sent to him. I asked him why he did not reply, and let the gardening world know that he was still alive; he said he did not think it was worth his while to do so. I should advise "Vagabond" to be quite certain as to the veracity of his anecdotes before he rushes them into print. *J. Wallis, Keele Gardens.*

FREESIA REFRACTA ALBA.—Seeing several notices in the *Gard. Chron.* lately of Freesias, I have pleasure in herewith sending a small bunch, and may remark that my mode of treatment differs in some measure from that recommended by some of your correspondents, and particularly in that I never cover the pots with anything when the bulbs are planted—I mean, I do not bury the pots or boxes in sand, coal ashes, or other material, as Hyacinths are done, and I think the plan a very bad one. I have grown Freesias largely some years, this year I have 50,000 bulbs. Lachenalia pendula, a bunch of which I enclose, I treat in the same manner as the Freesias. I have about 1000 in bloom now, and a very remarkable and pleasing patch of colour they make. *H. Elliott, Christchurch, Hants.* [Excellent blooms. Ed.]

GROS COLMAR GRAPE.—The correspondence on the above Grape is most interesting, and in some cases instructive; but your correspondent, Mr. Stephen Castle, makes (to my mind) rather singular statements. He considers it "prudent" of the gardener to take light crops from this variety, and "better to err on the side of a short weight of fruit than overcrop;" and yet, farther on, he would have one to believe, that to take a great weight of fruit from the Vines is conducive to high flavour. Does he really mean that to get good flavour in them they must be cropped to the extent of preventing them colouring well? if so, that is contrary to what I have found in practice; and I should like to hear what others have to say on the subject. I have frequently observed that the bad coloured fruit of this, or any other variety, fails to command the highest price in the market; and it is strange to hear that these are the best flavoured. I very much doubt if any grower would prefer to produce bad coloured than "sloe-black" fruit. It would be interesting to know the length of rod which Mr. S. Castle takes "crops up to half a hundredweight" from, "planted 3 feet apart?" This is, I consider, a very unsatisfactory method of describing a crop. If growers were to state the weight of fruit produced by a Vine, or Vines covering a certain space, it would be far more satisfactory. It is of no importance to a Vine whether it produces half a hundredweight or half a ton, providing it is allowed the necessary space to make provision for the crop. Some persons in giving the weight of fruit taken from Vines, do so rather indiscriminately, and often draw upon their imagination; but such statements are often misleading, and serve no useful purpose. *W. Simpson.*

—— In reply to your correspondent "Vagabond," p. 111 of the *Gardeners' Chronicle*, respecting the flavour of the above Grape, my experience is as follows:—Some years ago, when planting a house with Muscat Vines, two canes of Gros Colmar were also planted, and from being grown under Muscat treatment they produced for some years fruit of taking appearance and good flavour; but Gros Colmar being a very late variety, requiring a long season to fully ripen its fruit, I tried as an experiment the inarching of one rod on a Muscat Vine. The fruit from this union did not show any improvement in flavour, although there was an advantage, it always coloured and ripened quite a fortnight in advance of those Gros Colmar which were on their own roots. The Muscats having become exhausted in time, they were grubbed out, and the house replanted last spring; and Muscat Grapes being preferred, only one cane of Gros Colmar was planted, and this one was inarched on the Black Hamburgh, the motive for doing so being to ascertain if it would ripen any earlier on this stock than on its own roots, I may on some occasion report on the result of this experiment. *T. J.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

February 14.—Present: Prof. M. Foster, in the chair; Dr. M. T. Masters, Sir J. T. D. Llewelyn, Mr. McLachlan, Rev. W. Wilks, Dr. Michael, Prof. Church, Prof. Oliver, Prof. Farmer, and Rev. G. Henslow, Hon. Sec.

Soil with Mites, &c.—Dr. Michael reported upon a sample of earth sent from Jura Forest, and found that it contained wireworms, some Thysanuridæ and mites (Gamasidæ). The mites were in this case not injurious to plant life, but rather "friends," as they were predatory on other animals. In another sample sent there were Thysanuridæ and wireworms, but no mites. The soil being in a bad condition, should be treated with gas-lime, or other usual remedies for wireworm. Mr. McLachlan observed on the importance of such investigations as the present, as they revealed what creatures were "friends" to the cultivator, such being very often regarded unwittingly as "foes."

Parsnep devoured by a Vole.—Mr. J. Weathers exhibited for Mr. Noble a specimen from Bagshot, in which the whole of the interior had been consumed, nothing but a thin shell of cortex being left. He also showed a drawing of a monstrous Turnip, which had grown not unlike a Mandrake in form.

Burr Knot on Apple Roots.—Dr. Masters showed a specimen similar to the growth on the "Burr Knot" Apple, and which are sometimes used for propagating purposes. It was referred to Professor Farmer for examination.

Fog Report.—Prof. Oliver presented the second report on his investigations upon "The Effects of Urban Fog on Cultivated Plants," which will be printed and circulated for discussion at the next meeting. The following is a brief abstract:—"The report deals especially with the physiological aspect of the question, matters of more purely local interest being reserved for a forthcoming communication. The observed action of fog upon plants is described in detail, and the share taken in this action, by the reduction of light on the

one hand, and by atmospheric impurities on the other, is critically discussed in the light of the writer's experimental results. The position taken up by the author is, that 'fog' is, physiologically speaking, a much more complex affair than has been suspected. In presenting his report, Professor Oliver explained that the present contribution could only be regarded as a very imperfect statement of the subject, and that he was busily employed in following up some of the more novel lines which he has indicated." Professor H. Foster moved, and Mr. McLachlan seconded, the motion, that the report should be presented to the Council.

Arum with Two Spathes.—Dr. Masters exhibited a specimen of this common phenomenon, and remarked that no florist had made any attempt to fix it. The question was raised whether it was desirable to do so, as some thought that two spathes were no improvement to the flower.

African Produce.—Messrs. J. Wrench & Sons forwarded samples of leguminous and other seeds raised in S. Africa from English origin. As a general result they had remained constant in character. The Committee expressed their thanks to the exhibitors.

NATIONAL CHRYSANTHEMUM.

February 20.—The annual general meeting of members took place at Anderton's Hotel, Fleet Street, on the above date, Mr. Robert Ballantine in the chair.

The annual report was read by Mr. R. Dean. From this report we are enabled to glean the following particulars:—The Society has steadily increased in numbers and in importance, as shown by the large increase of members and affiliated societies. At the present time the members number 620, 73 of whom joined during the past year, and there are 100 affiliated societies, an increase of 14 during the year.

The supplemental catalogue of Chrysanthemums has been sold in a number of copies, and it is a valuable appendix to the list published in 1890.

The committee have entered into an arrangement with the Royal Aquarium Company to hold during the present year three exhibitions: one in October, one in November, and they have revived the mid-winter show by providing for a third exhibition in December. The September exhibition will be held by the Royal Aquarium Co., the committee providing prizes for several classes of Chrysanthemums. The conference on the subject of enlarged showboards for Japanese blooms, which was held at the Royal Aquarium in October last, brought together a number of persons interested in the exhibition of Chrysanthemums, and the result of the deliberations was a resolution carried in favour of enlargement. When the result came before the committee, they were of opinion that the time was not ripe for a compulsory enlargement, and by a considerable majority they resolved to adhere to the regulation already in force, which leaves it optional with exhibitors.

The income of the Society from all sources, amounted to the sum of £936 14*s.* 3*d.*, and the expenditure to within a few shillings of that sum.

The report and balance sheet were adopted, and thanks were given to the auditors—Messrs. F. Cobbold and G. J. Ingram. Sir Edwin Saunders was re-elected president. The names of Lord De L'Isle and Dudley, Sir Trevor Lawrence, Bart., Sir H. W. Peek, Bart., Leopold de Rothschild, Esq., W. Herbert Fowler, Esq., and C. C. Paine, Esq., were added to the vice-presidents. Mr. R. Ballantine was re-elected chairman, and Mr. E. C. Jukes vice-chairman of the committee. Mr. J. R. Starling as Treasurer; and Messrs. R. Dean and C. Harman Payne, General and Foreign Corresponding Secretaries.

Mr. H. Williams, Victoria Nurseries, Holloway, was unanimously elected one of the Auditors for the present year. Votes of thanks were passed to the President, Sir E. Saunders, and also to Lady Saunders; to the Auditors, and the Catalogue Revision Sub-committee; a vote of thanks to the Chairman closing the proceedings.

SCOTLAND.

SCOTTISH HORTICULTURAL ASSOCIATION.

A series of Technical Lectures in Horticulture is now being given under the auspices of this society. Mr. W. Ivison McAdam gave the first series, on "The Chemistry of Plants and Soils;" Mr. A. N. McAlpine, the second, on "The Structure and Physiology of Cultivated Plants;" and was followed by Dr. John Wilson, who took for his subject, "The Hybridisation, Selection, and Improvement of Plants." These lectures began on November 28, and have been delivered every Tuesday since that date.

February 15.—Mr. A. F. Barron, of Chiswick, lectured to the members of the Scottish Horticultural Association on "Hardy Fruits." Mr. M. Dunn, Dalkeith, occupied the chair, and there was a large attendance. During the last ten years, said Mr. Barron, a great amount of interest had been aroused in this country in fruit-growing. Various societies had been formed with that object, and if any dearth of literature on the subject existed prior to the date mentioned, it had been made up for since. Among this literature he mentioned *British Apples*, now in its second edition, as well as some works by Mr. Dunn and others. He was in favour of horticulture being taught in schools; it would be of far more use to many in their later years than the Greek or Latin they were at present being taught. Mr. Barron then proceeded to speak of various fruits; their pruning and training, planting and selection of soil, &c. Speaking first of Apples, he said there was a certain influence of scion over stock. The objects in pruning and training were two-fold—the obtaining of form and symmetry, and the production of fruit, and he admitted he liked to see trees well trained. In gardens they should always be a feature, for any fruit tree might be made very ornamental as well as useful. One of the leading principles in this training should be to keep the branches and shoots well apart, so that every part of the tree might be kept well open to light and air. They heard a good deal nowadays about the neglected state of their orchards, which used to be the glory of the country. What, he asked, was the cure for that? "Prune," said Mr. Barron. He next referred to planting and selection of soil for Apple trees, and afterwards spoke on Pears, their growing, gathering, and ripening; and Strawberries, Raspberries, and Gooseberries. Mr. Barron was awarded a vote of thanks for his paper.

Mr. George Phippen.—We learn with much regret, as this sheet is passing through the press, of the death, on the 23rd inst., of Mr. G. W. Phippen, of Reading, in his 29th year. Mr. Phippen was a very energetic man of business, and will be much missed.

MARKETS.

COVENT GARDEN, February 23.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Supplies unaltered, with prices firm. *James Webber, Wholesale Apple Market.*

Potatos.

The week's trade in old has been very bad. Stocks increase, and prices are anything but firm. Unless heavy orders for exporting come to hand, the outlook is a bad one for the remainder of the season.

New Potatos.—Arrivals this week comparatively lig' t, and prices well maintained. *J. B. Thomas.*

SEEDS.

London: *Feb.* 22.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that a quiet steady business is now doing. Many country seed merchants have already made their first purchases, and are consequently now pausing before further operating. All varieties of Clover seed exhibit great firmness. The frozen up German seed is still delayed, and it may be weeks before same reaches England. For imported and perennial Rye-grasses the tendency is still upwards. Spring Tares sell briskly at the late substantial advance; available supplies seem very nearly exhausted. Linseed is strong. In Bird seeds there is no new feature. Peas and Haricots are neglected. Mustard and Rapeseed show no alteration.

FRUITS AND VEGETABLES.

Borough: *Feb.* 21.—Quotations:—Savoys, 3*s.* to 5*s.* per tally; Sprouts, 8*d.* to 1*s.* 3*d.* per half-sieve; Turnip-tops, 3*s.* to 4*s.*; Broccoli, 1*s.* 6*d.* to 2*s.* per bag; Greens, 1*s.* 6*d.*; Parsley, 3*s.*; Carrots, 2*s.* 6*d.* to 3*s.* 6*d.*; Turnips, 1*s.* 6*d.* per dozen bunches; English Onions, 10*s.* to 12*s.* per cwt.; Dutch, do., 7*s.* per bag; Horseradish, 2*s.* 3*d.* to 2*s.* 6*d.* per bundle; Apples, 4*s.* 6*d.* to 6*s.* per bushel.

Spitalfields: *Feb.* 21.—With a good all-round supply demand was very dull, and prices consequently unaltered.

Stratford, *Feb.* 21.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Savoys, 2*s.* to 5*s.* per tally; Greens, 1*s.* to 1*s.* 6*d.* per bag; do., 2*s.* to 2*s.* 6*d.* per dozen; Cauliflowers, 9*d.* to 1*s.* 6*d.* per dozen; do., 3*s.* to 7*s.* per tally; Turnips, 40*s.* to 45*s.* per ton; Carrots, household, 46*s.* to 50*s.* do.; do., cattle-feeding, 26*s.* to 34*s.* do.; Parsnips, 6*d.* to 1*s.* per score; Mangels, 17*s.* to 20*s.* do.; Swedes, 17*s* to 20*s.* do.; Onions, English, 210*s.* to 230*s.* do.; do., Dutch, 7*s.* 9*d.* to 8*s.* 6*d.* per bag; do., Bordeaux, 8*s.* to 8*s.* 6*d.* per case; Apples, English, 2*s.* to 6*s.* per bushel; do., American, 12*s.* to 20*s.* per barrel; Brussels Sprouts, 1*s.* to 1*s.* 3*d.* per half-sieve; Turnip-tops, 2*s.* 9*d.* to 3*s.* 3*d.* per bag; Brussel-tops, 1*s.* to 1*s.* 6*d.* per bag.

Farringdon: *Feb.* 23.—Quotations:—English Onions, 11*s.* to 12*s.* per cwt.; Carrots, 50*s.* to 60*s.* per ton; Turnips, 40*s.* to 50*s.* do.; Broccoli, 1*s.* 3*d.* to 1*s.* 6*d.* per bushel; Savoys, 4*s.* to 5*s.* per tally; Apples, Baldwins, 15*s.* to 18*s.* per barrel; Greenings, 16*s.* to 18*s.* do.; Grapes, Almeras, 16*s.* 6*d.* per barrel; Pine-apples, 1*s.* 9*d.* to 2*s.* 6*d.* each.

POTATOS.

Borough: *Feb.* 21.—Quotations:—English Magnums, 45*s.* to 60*s.* per ton. Other sorts unchanged.

Stratford: *Feb.* 22.—Quotations:—Magnums, 45*s.* to 65*s.*; Bruces, 50*s.* to 70*s.*; Imperators, 50*s.* to 60*s.*; Scotch Magnums, 60*s.* to 75*s.*; Main Crop, 90*s.* to 100*s.* per ton.

Farringdon, *Feb.* 23.—Quotations:—Main Crop, 90*s.* to 100*s.*; Sutton's Abundance, 80*s.* to 90*s.*; Bruce's Magnums, 65*s.* to 75*s.*; English do., 60*s.* to 65*s.*; Black-lands, 45*s.* to 50*s.* per ton.

London Averages: *Feb.* 22.—Quotations:—Magnums, 50*s.* to 70*s.*; Hebrons, 65*s.* to 70*s.*; Regents, 60*s.* to 75*s.*; Imperators, 60*s.* to 70*s.*; Snowdrops, 70*s.* to 80*s.* per ton. New:—Jerseys, 4*d.* to 8*d.* per pound.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80*s.* to 112*s.*; do., inferior, 70*s.* to 75*s.*; hay, best, 75*s.* to 102*s.*; do., inferior, 65*s.* to 75*s.*; and straw, 28*s.* to 44*s.* per load.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending February 19, and for the corresponding period last year:—1893: Wheat, 25*s.* 7*d.*; Barley, 24*s.* 11*d.*; Oats, 17*s.* 10*d.* 1892: Wheat, 32*s.* 1*d.*; Barley, 28*s.*; Oats, 20*s.*

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Above (+) or below (—) the Mean for the week ending February 18.	Temperature. Accumulated. Above 42°, for the Week.	Below 42°, for the Week. The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending February 18, is furnished from the Meteorological Office:—

"The *weather* during this week continued very unsettled and rainy in all parts of the kingdom. Much cloud prevailed over the country as a whole, but in Ireland and the greater part of Scotland many bright intervals were experienced.

"The *temperature* just equalled the mean in Ireland and in the west of Scotland; it was slightly below it in 'Scotland, N. and E.,' but elsewhere it was in excess by 1° to 3°. The highest of the maxima were recorded on the 18th, when they ranged from 58° in 'Ireland, S.,' and 57° in 'England, N.W.,' to 53° in 'Scotland, N. and W.,' 'England, S.W.,' and 'Ireland, N.' The lowest of the minima were registered during the earlier part of the period, when the thermometer fell to 9° in 'Scotland, E.' (at Braemar), to 16° in 'Scotland, N.' (at Glencarron), to between 23° and 31° in most other districts; and to 38° in the 'Channel Islands.'

"The *rainfall* just equalled the mean in 'England, E.,' but exceeded it in all other districts, the excess being very considerable in the west and north.

"The *bright sunshine* exceeded the normal in Ireland and the north and east of Scotland; but was deficient in all other districts. The percentage of the possible duration ranged from 18 to 33 in Scotland, from 28 to 29 in Ireland, and from 16 to 20 over England."

NOTICES TO CORRESPONDENTS.

Black Soap: *D. K.* Another name for "soft soap."

Books: *E. Nash. The Propagation and Improvement of Cultivated Plants* (F. W. Burbidge), William Blackwood & Sons, London and Edinburgh. It is, we believe, out of print; second-hand price, about 5*s.* *The Rose Garden* (W. Paul), ninth edition. Price, not less than 30*s.* Kent & Co., 23, Paternoster Row, London; also of the author, at Waltham Cross, Herts, and many cheaper books. *Chrysanthemums and their Culture* (E. Molyneux). Published at 171, Fleet Street, E.C., price 1*s.* *Handbook of British Mosses.* *Synopsis of British Mosses* (C. B. Hobkirk), L. Reeve & Co., price 7*s.* 6*d.* *British Ferns* (E. J. Lowe, Swan, Sonnenschein & Co.), and many others.—*J. P.* Johnson's *Gardeners' Dictionary*, new edition, G. Bell & Son, York Street, Covent Garden; *Carnation Manual*, published by Messrs. Cassell & Co. for the National Carnation Society.

Bothy Life: *H. R., C. H. W., A. F. D., and Others.* Great improvement has taken place in bothy life, but much remains to be done in places. We have no doubt that the gradual spread of education, and the formation of a race of student-workers instead of labourers, will effect a change for the better in all ranks of gardeners; but the change must be gradual, if it is to be general and permanent. Agitation will only do mischief.

Dendrobes in Flower: *John Laing & Sons.* The flowers sent of D. nobile cœrulescens, D. Wardianum, D. crassinode, and D. Ainsworthi variety are fairly good. The first is not so good as the finer forms of D. nobilis nobiliar.

Modern Journalism: *B.* Do you think it right to write on the same subject to several papers, and to expect to be paid for your contributions from each of them? There are cases, of course, where the fullest and widest publicity is desirable, but this is not one of them, and, if you are a paid contributor to one journal, you should not, as a rule, in our opinion, write on the same subject in another. Readers of the papers naturally do not want to see the same subjects handled by the same writers in all the journals, nor do editors care to pay for what is everyone's property. We cannot interfere in the matter.

Mushrooms: *A. P.* The growth of the Mushrooms has been arrested by want of heat in the bed.

Names of Fruits: *W. C. C.* Apple Golden Reinette.—*T. C.* 1, Brabant Bellefleur; 2 and 5, Dumelow's Seedling; 7, Tibbett's Pearmain; 8, Malster's; 9, Syke House Russet. Others too much bruised.

Names of Plants: *W. W.* 1, Eranthis hyemalis, or Winter Aconite; 2, Helleborus fœtidus; 3, Rubus rosæfolius.—*G. H.* 1, Eranthis hyemalis; 2, Celsia cretica; 3, Eupatorium grandiflorum album.—*T. B.* 1, Eucalyptus globulus; 2, Agapanthus umbellatus variegatus.—*J. Krupp.* The purple marking on the leaves of Lælia crispa and some other Orchids is perfectly natural, and many growers regard it as an indication of good health.—*G. A.* A very fine variety of Cattleya Percivaliana.—*Thos. W.* Dendrobium primulinum.—*H. W. W.* 1, Odontoglossum Andersonianum; 2, O. crispum, a very fine variety.—*Wm. W.* 1, Cœlogyne flaccida; 2, Cypripedium Hookeræ var.; 3, Dendrobium Findlayanum.

National Rose Society: *H. W. D.* There is no difficulty in becoming a member. The secretaries are Rev. H. H. D'Ombrain, Westwell Vicarage, Ashford, Kent; and Mr. Ed. Mawley, Rose Bank, Great Berkhamstead.

Staff of Gardeners in a Garden of 2½ Acres, with Stove, Greenhouse, Vineries, Conservatory, Mushroom-house, Lawns, Flower-Garden, &c.: *X.* The number of workmen would greatly depend on the style in which the gardens have to be kept; and if a constant supply of vegetables, flowers, and fruit is expected, or only for a season, or if the needs of the family are large; plain gardening, not much forcing of vegetables and plants carried out, and no labour supplied to the house, you might, with careful apportioning of the various jobs, manage with two good men and one boy. If, on the contrary, plant growing and flower and vegetable forcing, receive much attention, lawns are frequently mown, and sweeping and rolling well carried out, bedding out of tender plants practised, or carpet-bedding is a feature of the garden, or there is much Box or other edging and hedges, and the kitchen garden walls are planted with large fruit trees, the staff would not be too strong if fixed at four men, and one boy or woman.

Tobacco Cloth: *F. J. B.* The cloth is as described, and does very well for large plant houses, but we should not recommend such material when fumigating Orchids. In such a case it would be much safer to use pure tobacco, or better still some of the fumigating cones advertised by the sundriesmen, and which have been specially prepared for use amongst choice and delicate plants.

Variegated Brussels Sprouts: *J. F.* The specimen sent shows a pretty kind of variegation, but even if fixed and coming true from seed, it does not seem to us to have culinary or decorative merit.

Vine Growth: *Foreman.* The rule is not absolute; the figure you speak of was probably a correct representation of what the artist saw. A well-known Grape-grower says he has often seen it so. It would be interesting and useful to know if particular varieties show any differences in this respect. Keep a look out.

Winter Aconites: *A Subscriber, Worksop.* The difference in the time of flowering of patches A and B may be traceable to some slight difference in the porosity and texture of the soil; also to the fact that A, the earlier bloomer, being longer planted than B, has lessened vigour from loss of nutriment in the long-occupied soil, and has its roots nearer the surface, and consequently is more readily excited by the sun's heat. There was no difference in the form of the two flowers beyond what a more vigorous growth in the case of one of them might account for.

Worms: *R. N.* They are not the true eel worms which require a powerful microscope for their detection. We do not think the grubs you send are injurious, they eat the decayed vegetable matter

AUTOMATIC DAMPER

FOR GREENHOUSES.

Dr. GEORGE WALKER, Inventor of Chrysanthemum Cup Tubes, Wimbledon, says:—"I have used your Automatic Damper for some weeks, and am perfectly satisfied with it. A most ingenious and useful invention."

Mr. H. J. JONES, Hither Green, Lewisham, who uses the Damper in a house 100 feet long, says:—"I find this damper is in every way economical. Its saves both fuel and labour, and keeps the house at a more even and better temperature."

97, FLEET STREET, LONDON, E.C.

"LINDENIA,"

ICONOGRAPHY OF ORCHIDS.

Conducted by J. LINDEN, LUCIEN LINDEN, *and* EM. RODIGAS.

The Coloured Portraits by P. DE PAUNEMAEKER, A. GOOSSENS, et J. GOFFART.

"'LINDENIA'—Part XXIII, of the English Edition of this, *the best current work on Orchids*, is, we think, on the whole superior to any which have preceded it. The *plates are models of excellence*, and *so true to the materials* from which they have been prepared, that one could almost fancy the flowers were living things, and not the work of the artist. The literary matter, too, is full of interest—the knowledge which it imparts is *of the most instructive and utilitari in type*"—*British Gardening*, January 5, 1893.

"'LINDENIA' is a worthy rival of its English competitors."—*The Garden and Forest*, April 29, 1891.

"'LINDENIA.'—The more we see of this excellent organ the more are we convinced of its superiority over anything else of the kind at present published. There is no disputing the fact that Messrs. Linden are the kings of Orchid literature. The best proof we have of this is in the style and get-up of their incomparable Iconography of Orchids. The current number is one of the most interesting of the series. Its interest is intensified by the fact that it contains two superb plates of the renowned Princess of Wales' Cattleya. These plates truly justify and confirm all that has hitherto been spoken in favour of this desirable plant. The first plate is a marvel of the artist's skill; it represents a marvellously good spike of Cattleya Alexandræ, L. Lind. et Rolfe var. tenebrosa Rolfe."—*British Gardening*, February 2, 1893, p. 57.

☞ *"LINDENIA" is the only work especially devoted to Orchids, with Coloured Plates, which is* regularly published *every month.* ☜

☞ "IT IS THE CHEAPEST and FINEST OF ALL." **Each Monthly Part contains 4 Plates.** TERMS OF SUBSCRIPTION:—**Six Months, Half-yearly Volume, 25s.** ☜

Published by **LUCIEN LINDEN**, Esq., 100, Rue Belliard, Brussels (Belgium).

May also be had at all the Principal Libraries, and from MR. P. WEATHERS, POPLAR VILLA, SOUTHGATE, LONDON, N.

THE MOST SUITABLE FOR
SHADING ORCHIDS, FERNS,
Palms, and Stove and
GREENHOUSE PLANTS.

WILLIAMS' HOTHOUSE SHADING.

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.

It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. The leading Orchid and Plant Growers in the country have used this material for some years, and speak very highly of it, pronouncing it to be the very best material for Plants they have ever used.

Blinds made up and fixed complete.

Sold in pieces, 30 yards long by 1½ yard wide. Price 40s. each. Samples submitted gratis.

THE IMPROVED GARDEN GULLY

(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794,

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation, Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for Terms.

SPECIMEN FREE. *Price 2d.*

WANTED, a thoroughly experienced FOREMAN, for the Furnishing Department of a high-class London Nursery. A middle-aged man, of good address, to wait upon Ladies and Gentleman at their houses, and competent to give Estimates, and to suggest improved ideas in the art of Floral Displays. To the right man this will prove a permanent and lucrative situation.— Apply, in first instance by letter only, to KENTIA, care of Messrs. Osman & Co., 132, Commercial Street, London, E.

WANTED, as WORKING FOREMAN, an experienced and energetic MAN, to Build Large Vineries well and cheaply, this Spring and Summer, and take charge of what may eventually become an important Fruit-growing Farm (all under glass). In addition to wage, a 10 per cent. bonus upon net profits will be given. Only practical men who have had marked success with the profitable Growing and Sending to Market of large quantities of Grapes, Mushrooms, Tomatos, &c., need apply, by letter, with reference, stating wage required to TURO, Dunellen, Putney, S.W.

WANTED, a PROPAGATOR, used to General Inside Work. ALSO a young MAN, used to Cucumbers, &c., Potting and Watering.—Apply, stating wages required, to WALSHAW AND SON, Scarborough.

WANTED, a good PROPAGATOR and GROWER under a Foreman.—Specialties, Chrysanthemums, Table Plants and Cut Flowers in quantity. Must be a good hand at Wreaths, Posies, &c., and have had experience in Decoration for Weddings, Balls, &c. Apply, stating age, references, wages required, two last situations, to JAMES SMITH, Nurseryman, Birkenhead.

WANTED, a young MAN, who has served his time at Herbaceous Plant-growing, and thoroughly understands the Propagation of same. A good writer indispensable.—Apply, by letter, to R. N., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a young MAN, where Cucumbers, Tomatos, &c., are grown. Must be quick at Watering, Potting, and Tying. Wages, 18s. per week. — Apply, YOUNG AND SON, Town Road Nursery, Lower Edmonton, N.

WANTED, SIX young MEN, used to General Nursery Work, Roses, Carnations, Chrysanthemums, &c.; also TWO accustomed to Potting and Tying. —Apply, stating wages, and where last employed, to G. BECKWITH AND SON, Florists, Hoddesdon, Herts.

WANTED, a young MAN, accustomed to General Plant Work, in the Houses under Foreman. —Full particulars to RICHARD SMITH AND Co., St. John's Nurseries, Worcester.

WANTED, for a Small Nursery, an energetic industrious MAN, with a general knowledge of Nursery Work, Inside and Out, able to Work up Stock, Grow for Market, and take charge in absence of principal. Particulars and wages expected, to OVA. *Gardeners' Chronicle* Office, 41, Wellington Street, Covent Garden, London, W.C.

WANTED, a young MAN accustomed to Market Work, Palms and Ferns principally. Must have good references. State age, experience, and wages. Permanent situation. — H. MARSHALL, The Nurseries, Barnham, Bognor.

WANTED, a young MAN for a small Market Nursery and to do Jobbing Work. Wages, 18s. per week.—J. T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a young MAN, for Plant and Fruit Growing under Glass; none but experienced hands need apply, by letter only.—WM. TAYLOR, Bently Priory Gardens, Stanmore.

WANTED, young MAN, about 18, quick at Potting and Tying.—PATES AND SHARPE, Imperial Nurseries, Cheltenham.

WANTED, MEN, experienced in Fruit and Flower Growing under Glass. Wages from £1 per week, with overtime in addition.—Apply to FOREMAN, Thomas Rochford, Turnford Hall Nurseries, near Broxbourne, Herts.

Trade.

WANTED, a good INDOOR MAN, well up in the Growing of Market Plants, &c., to take the place of one going abroad. State age, wages, and experience to WM. TROUGHTON, Nurseryman, Preston, Lancashire.

WANTED, an IMPROVER, one accustomed to work under Glass. State age, wages expected, and references, to CRANE AND CLARKE, Hillside Nursery, March, Cambs.

WANTED, a young LADY for Seed, Flower, and Fruit Shop, and willing to Assist with House-work To live out. Wages, 18s. per week.—J. T., *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W.C.

WANTED, a respectable energetic young MAN, for Pleasure Grounds. Accustomed to Scythe, machine, and general Pleasure Ground work. Wages, 15s. Bothy.—Address, stating age, &c., to THE GARDENER, Frensham Place, Farnham, Surrey.

Cashier and Head Book-keeper.

MESSRS. JAMES VEITCH AND SONS REQUIRE a thoroughly experienced person in the above capacity. Character must bear the strictest investigation. —Apply, by letter only, to ROYAL EXOTIC NURSERY, King's Road, Chelsea.

WANTED, a JOURNEYMAN, Inside, under a Foreman.—12s. per week, bothy, and vegetables.—GARDENER, Sezincot, Moreton-in-March, Gloucestershire.

WANTED, a first-class ASSISTANT for Florist's shop. Must be a good Salesman and Arranger. ALSO WANTED, a MAN for the Houses. Good Soft-wooded Propagator and Plantsman. State full particulars to H. ENGLISH, Clevedon Nurseries, Clevedon.

WANTED, a young MAN, for the Houses, used to Covent Garden Trade and Bulb Forcing preferred. Expenses paid, and permanent place for suitable man —A. MAWER, Clarendon Nursery, Sale, near Manchester.

WANTED, active and intelligent young MAN, of good character, for working in the Houses, and general Nursery Work. Apply to Mr. W. RUMSEY, Joyning's Nurseries, Waltham Cross.

WANT PLACES.

TO GARDENERS AND OTHERS SEEKING SITUATIONS.

The pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

TO FLORISTS.—A thoroughly experienced and artistic Florist, reliable man, seeks situation in a first-class business.—A., *Gardeners' Chronicle*, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS. — WEARY OF LIFE.—Derangement of the Liver is one of the most efficient causes of dangerous diseases, and the most prolific of those melancholy forebodings which are worse than death itself. A few doses of these noted Pills act magically in dispelling low spirits and repelling the covert attacks made on the nerves by excessive heat, impure atmospheres, over-indulgence, or exhausting excitement. The most shattered constitution may derive benefit from Holloway's Pills, which will regulate disordered action, brace the nerves, increase the energy of the intellectual faculties, and revive the failing memory. By attentively studying the instructions for taking these Pills, and obediently putting them in practice, the most despondent will soon feel confident of a perfect recovery.

Also *Select Orchidaceous Plants*, by Robert Warner, with Culture Notes by Messrs. B. S. Williams & Son.

On view morning of Sale, and Catalogues had.

NEW WHITE GRAPE—"CHASSELAS NAPOLEON."

WM. CUTBUSH & SON having acquired the whole of the stock of the above from the raiser Mr. GEORGE REYNOLDS, Gardener to Messrs. Rothschild, Gunnersbury Park, Acton, London, W., are prepared to receive orders for immediate delivery of strong planting canes. It has been awarded a First-class Certificate by the Royal Horticultural Society.

Extract from *The Garden*, October 31, 1891. F.C.C., October 27, 1891, R.H.S.

"GRAPE 'CHASSELAS NAPOLEON.' — This is a white variety of much promise, with large Muscat-like berries, but of paler colour. The bunch shown was cut from a Vine worked upon a Muscat. It is a good keeping kind, and of capital constitution."

Extract from the *Gardeners' Magazine*, November 7, 1891.

"GRAPE 'CHASSELAS NAPOLEON.'—This appears to be a Grape of great promise. It is of the Sweetwater type, the flavour sweet, refreshing and pleasant, and the bunches large, well-formed, and handsome on the table; the berries white, large, and oval. It is hardy, free cropping, of fine appearance, hence the value to the exhibitor, and acceptable on the table. Small wood, carries good clusters. First-class Certificate, October 27, 1891, R.H.S.

Extract from the *Journal of Horticulture*, October 29, 1891. F.C.C., October 27, 1891. R.H.S.

"VINE 'CHASSELAS NAPOLEON.'— For this a First-class Certificate was awarded, as it was in extremely fine condition. The bunches large but compact; the berries large and oval, white, with an amber tint, fleshy, and of good flavour."

Extra Strong Planting Canes, 21s. each.

Grape Growers who have not secured LADY HUTT and APPLEY TOWERS GRAPES should do so as early as possible, as the Stock is being greatly reduced. Strong Fruiting Canes of each, 30*s.* each; Strong Planting Canes of each, 21*s.*

WM. CUTBUSH and SON, Highgate Nurseries, London, N.; and Barnet, Herts.

Wednesday Next.

EARL'S COURT EXHIBITION.

EXHIBITION OF GARDENING and FORESTRY.

The Exhibition will Open on the 13th of May, and Close about the middle of October.

Exhibits have been promised by the British and several Foreign Governments, and the most prominent Horticulturists and Foresters have expressed their desire to help.

FORTNIGHTLY FLOWER SHOWS
WILL BE HELD, COMMENCING ON 13TH MAY.
For particulars see Special Schedule.

CLASSIFICATION of EXHIBITS.
Medals, and Certificates will be awarded.

Group 1.—Gold, Silver, and Bronze Medals and Certificates.—(*a*) Specimens of new and rare-flowering trees and shrubs; (*b*) Forest flora; (*c*) Collection of seeds, cones, &c.; (*d*) Forest fauna and entomology; (*e*) Specimens of damage done to timber and growing wood by insects, &c.

Group 2.— Gold, Silver, and Bronze Medals and Certificates.—Growing Collection of Trees and Shrubs: (*a*) Deciduous and evergreen, indigenous and exotic, in classes; (*b*) Deciduous and evergreen, indigenous and acclimatised, with special reference to the grouping for effect; (*c*) Undergrowth for coverts, &c.; (*d*) Fruit trees, trained.

Group 3.—Gold, Silver, and Bronze Medals.—(*a*) Garden and forest literature; (*b*) Working plans of Gardens, forests, and plantations; (*c*) Valuations and survey of estates; (*d*) Charts illustrative of the geographical distribution of trees, their adaptability to various soils, their rate of growth, &c.; of the sequence of plants, natural or artificial; (*e*) Specimens of fossil trees.

Group 4.—Gold and Silver Medals. — Hybridisation of Plants. (*a*) Specimens of a hybrid, accompanied by the two parent species or varieties, indicating which of these has furnished the pollen. (*b*) Specimens of a hybrid A × B produced by crossing the two species or varieties A and B—the plant A having furnished the pollen; and specimens of a hybrid B × A produced by the crossing of the same species or varieties A and B—the plant B having furnished the pollen. The plants A and B must accompany the hybrids.

Group 5.—Gold and Silver Medals.—Collection of Timber Specimens and Ornamental Woods, Rough and Polished: (*a*) Indigenous; (*b*) Exotic.

Group 6.—2 Gold, Silver, and Bronze Medals.—Wood-working Machinery; (*a*) Sawing, planing, moulding, lathes, &c.; (*b*) Implements and tools used in gardening and forestry; (*c*) lawn-mowers, rollers; (*d*) Digging and draining tools, axes, pruning tools, pumps, cutlery; (*e*) Appliances for the transport of timber; and (*f*) The transplanting of trees.

Group 7.—Gold Medal.—Wood Engraving, with Samples of Wood; special attention being given to the supply of Boxwood (Buxus sempervirens) or its substitutes.

Group 8.—Gold, Silver, and Bronze Medals.—(*a*) Woods used for ordnance and small-arms, backing for armour-plates, lance-stocks, &c.; (*b*) Wheels; (*c*) Sleepers and rolling stock of railways, telegraph-poles, &c; (*d*) Paving or street purposes; (*e*) Mining timber; (*f*) Bent timber.

Group 9.—Two Gold, Silver, and Bronze Medals.—(*a*) Woods used for parquetry, with examples; (*b*) Mosaic; (*c*) Wood-block flooring; (*d*) Ceilings, wainscoting, and internal wall decorations; (*e*) Household furniture.

Group 10.—Silver and Bronze Medals.—(*a*) Fibres; (*b*) Wood-pulp materials used for paper-making; (*c*) Ropes, lines, and twines; (*d*) Resins and oils; (*e*) Dyes and stains; (*f*) Barks; (*g*) Spices.

Group 11.—Gold and Silver Medals.—(*a*) Wood-carving; (*b*) Turnery; (*c*) Decorative painting on wood.

Group 12.—Gold, Silver, and Bronze Medals.—Processes for the preservation of timber.—(*a*) To resist wet and dry-rot; (*b*) To resist fire; (*c*) Paints and other wood-preserving compositions.

Group 13.—Silver and Bronze Medals.—Fertilisers and Artificial Manures.

Group 14.—Silver and Bronze Medals.—(*a*) Garden pottery; (*b*) Statuary vases; (*c*) Edgings, &c.

Group 15.—Silver and Bronze Medals.—Miscellaneous accessory Decorations to a Garden.

Group 16.—Silver and Bronze Medals.—(*a*) Fancy woodwork; (*b*) Baskets; (*c*) Bamboo canes, Willows, &c.

Group 17.—Gold, Silver, and Bronze Medals.—(*a*) Plant-houses; (*b*) Show and growing-houses; (*c*) Systems of glazing; (*d*) Heating.

Group 18.—Gold, Silver, and Bronze Medals.—(*a*) Fencing; (*b*) Gates; (*c*) Tree-guards.

Group 19.—Gold, Silver, and Bronze Medals.—(*a*) Summer-houses; (*b*) Châlets, kiosks; (*c*) Garden-seats; (*d*) Flower-stands; (*e*) Boats, canoes, &c.

Group 20.—Gold, Silver, and Bronze Medals.—Distillation and Preparation of Scents, and Flowers and Woods used.

Group 21.—Gold and Silver Medals.—(*a*) Settlements in new countries, showing camps and camping contrivances; (*b*) Cultivation of Tea, Coffee, Opium, Cinchona.

Group 22.—Gold and Silver Medals.—(*a*) Sporting trophies; (*b*) Pictures of forest trees.

Group 23.—Gold and Silver Medals.—Any Exhibit not particularised in the above Groups, in furtherance of the objects of the Exhibition, will be admitted.

All exhibits must be submitted to the approval of the Executive, who retain the absolute right to admit only such exhibits as they may approve, to appoint Judges, and award the Medals and Certificates. The Judges will be instructed to recommend additional medals should they think any exhibit worthy of special distinction; and the right is also reserved to withhold medals offered in any group should the Judges determine that the exhibit is not sufficiently meritorious. Application Forms, copies of the Rules and Regulations, and all particulars, can be obtained on application to the Secretary.

H. E. MILNER, Chairman.
GEORGE CADELL, (late) Indian Forest Department, Vice-Chairman of Committee, Forestry Section,
HARRY TURNER, Royal Nurseries, Slough, Vice-Chairman of Committee, Horticultural Section.
G. A. LOVEDAY, Earl's Court Exhibition, S.W., Secretary.

WHEELER'S
NEW POTATO,
"THE ALDERMAN."

For Exhibition this Potato is a model—the eyes are shallow, the skin rough; it is of large size, a great cropper, and of the finest possible quality; it withstands disease well, and is one of the most profitable Potatos to grow.

Price 4/- per peck; 12/6 per bushel.

"I am specially pleased with 'THE ALDERMAN' Potato, and consider it one of the most valuable introductions."—J. H. FRY.

"From the 3 lb. ALDERMAN POTATOS I raised 93 lb. grand tubers, many weighing from 1 lb. to 1½ lb., and when cooked they are very white and floury, and for quality unsurpassed. This crop was grown in wet and poor soil, and not one diseased in the crop."—E. CRUMP.

Upwards of a hundred other testimonials, copy of which may be had gratis and post-free on application.

UP TO DATE PEAS.

CARTERS' DAISY.

(THE MOST DELICIOUS FLAVOURED PEA.)

A new dwarf sweet-flavoured Marrowfat Pea.

A Fellow of the Royal Society who inspected our Crop of Daisy Peas, says:—

"Many have seen illustrations of rows of Pea-haulms propped up and supported by the ripening pods, and many have smiled sceptically at what they considered the playful imagination of the artist. A visit to Messrs. Carters' field of Daisy Peas suffice to show that had the artist been present at Bromley he would not have had to tax his imagination much. There were about three acres under growth in rows three feet apart, and throughout the crop was uniformly large"

Awarded two years in succession the highest honours of the Royal Horticultural Society after thorough trial.

Price in Sealed Packets, 3/- per ¼ pint; 5/- per ½ pint, post free.

For full description, see Carters' Illustrated Catalogue, post free on application.

WEBBS, WORDSLEY, STOURBRIDGE.

THE
Gardeners' Chronicle.

SATURDAY, MARCH 4, 1893.

AGRICULTURAL RETURNS FOR 1892.

IT is not so long since farmers, and gardeners too, for that matter, objected to give any assistance in the compilation of official statistics. They had a wholesome dread of fresh or of increased taxation. They did not realise that the information obtained could be used for any but oppressive purposes, and they were too ill-informed to appreciate the value of carefully obtained and carefully digested statistics. The cultivator always professed his love for facts, but he did not care for any facts beyond those which he could glean for himself within the four corners of his own premises. For other people's facts he had a profound contempt. Improved education, and specially the stress of foreign competition, have altered this state of things. The love of "facts" is as great as ever—nay, greater; it has happily grown so that no one is any longer satisfied with his own limited range, but extends his gathering ground as widely as he can. Moreover, with the progress of time, has come a better appreciation of the proportion and of the relative importance of facts. The causes of any particular depression, if not known in their entirety, are at least now known to be complex, and not to be attributable to any one cause, and therefore not remediable by any quack remedy, however plausible it may be in appearance. A glance at the "Agricultural Returns of Great Britain" for 1892, which has just been published, at a cost of one shilling, by Eyre & Spottiswoode, and which may be had from any bookseller, will furnish the reader with abundant opportunities for indulging in this description of comment. Much of the information contained in the Report is out of our scope, so that we shall confine ourselves to calling the attention of our readers to one or two matters in which they are likely to be specially interested, leaving them to make fuller perusal of the document for themselves.

Arable land has steadily diminished in amount during the last twenty years to the extent of more than two millions of acres, but this diminution does not apply to Scotland, where there has been an actual increase of 78,000 acres. On the other hand, the area under grass has increased in greater proportion than the arable land has diminished, owing to reclamations and extensions.

Hops are chiefly grown in Kent, which yields more than one-half of the annual crop; nevertheless, there has been a diminution in the acreage during the last twenty years to the extent of nearly 4000 acres.

Nursery grounds in England covered in 1892 a total area of 11,331 acres—practically the same as in the preceding year. The largest county acreage is Surrey, with 1733—more than

*

double that of any other county; the next in order being the West Riding of Yorkshire, with 702 acres; Chester has 597 acres; Hertford, 509; Kent, 728; Middlesex, 694; Worcester, 290; and so on, till we come to Rutland, with 12, and Westmoreland, with 11 acres only.

In Scotland, the total acreage of nursery grounds in 1892 is given at 1383, of which 372 are in the county of Edinburgh, 152 in Dumfries, 107 in Aberdeen, one only in Sutherlandshire; whilst Caithness, Kinross, Linlithgow, Orkney, and Shetland, have none at all.

Market gardens in Great Britain are accredited with a total acreage of 83,081, as compared with 81,368 in 1891. Kent heads the list with over 12,000 acres, Middlesex comes next with 8989, then Bedford with 6828; Worcester, 4856; Essex, 4105; Surrey, 3763. After these there is a sudden drop, and, after that, a gradual diminution, till, in Westmoreland we find only 24 acres returned as under market cultivation.

In Scotland alone there are 5322 acres under market gardens, the largest acreage being in Lanarkshire, 1378; and Edinburgh, 1020; whilst Sutherlandshire is at the other end of the list with 1 acre —one more than in 1891!

Orchards were represented in 1892 as occupying an area of 208,950 acres, a slight diminution in acreage as compared with previous years.

But it is to the returns relating to fruit culture that we desire particularly to call the attention of our readers. In Great Britain and Ireland it is satisfactory to find an increase of 3425 acres devoted to small fruit culture.

In the year 1892 we learn that the number of acres devoted to small fruits in the grazing or Western Counties of England was 17,064, a percentage of 0·1. In the corn-growing Eastern Counties, the figures are 39,438, and the percentage 0·3; the total percentage for all the English counties being still only 0·2. In reference to this subject, we take the following extract:—

"The area under small fruit again shows an increase. The area returned for Great Britain was 62,148 acres, of which 56,502 were in England. Although every English county now returns a certain acreage under this head, there are only five where as much as 2000 acres is returned. Kent heads the list with 19,821 acres; no other county at all approaches this total. The acreage returned in Middlesex is now 3718 acres, Worcester returns 2421 acres, Lancashire has 2192 acres, and Cambridge 2064. Full details are given in Table XIII., which indicates the extent to which Gooseberries, Strawberries, Raspberries, and Currants (all grouped under the title of small fruits) are cultivated either along with larger fruit trees in orchards, or in market gardens, or as a farm crop on other land."

The imports of fruit are alluded to monthly in our columns, and in the return before us we have a statement of the quantities and values of imported fruits, nuts, and vegetables for ten years. We can only say, by way of illustration, that in 1891, the number of bushels of Apples imported was 3,147,373, of the value of £1,033,997.

In the same year, 3,192,836 cwt. of Potatos, of the value of £1,196,824, were imported, which as we see by another table, means 9 lb. per head of the entire population.

Onions in 1891 were imported to the extent of 4,281,046 bushels, valued at £733,745.

The total value of all kinds of fruits, nuts, and vegetables imported in 1891, amounted to £8,311,209.

No fewer than 1,275,398,000 eggs were imported, valued at £3,506,000. France and Germany supply more than half of this enormous number, Belgium, Russia, and Denmark coming next. The Canadian quota has increased from 2,000,000 to 33,000,000 in a single year, and we have now laid under contribution a variety of minor sources, among which it is curious to note the Canary Isles, Turkey, and Egypt! These figures are certainly astounding. In another table we find that thirty-four such eggs were eaten by each member of the entire population of the United Kingdom. It is evident we could not raise enough for our own consumption within our small islands, but that it should pay commercially to bring such things as eggs from such very distant countries surely suggests a lesson to our people, and accounts for the difficulty of procuring new-laid eggs in London

The report goes on to enumerate the corresponding statistical details relating to agricultural products of foreign countries, and of our own colonies. These figures should be most carefully studied, and taken to heart, by Freetraders and Protectionists alike.

New or Noteworthy Plants.

CATTLEYA SUB-VAR. REINECKIANA.

This is a form of the Mossiæ variety of Cattleya labiata (*Gard. Chron.*, 1884, ii., p. 172, fig. 33). "This handsome Cattleya was originally described by Reichenbach in Seemann's *Bonplandia* for 1856, whence we learn that it was introduced from Caraccas by Karsten, and flowered first in the collection of Herr Decker, under the charge of his gardener, Reinecke. It was described as very beautiful, pure white, with the disc of the lip covered with radiating nerves of amethyst and yellow. In short, it is an albino of C. labiata var. Mossiæ, in which the amethyst nerves are present on the yellow disc, while in the other white sub-variety, Wagneri, the yellow disc alone remains, the coloured nerves being quite obliterated." *R. A. Rolfe*, in *Reichenbachia*, t. 51.

Galanthus Perryi, *Hort. Ware.*

This is a Snowdrop which was introduced not very long ago by Messrs. T. S. Ware & Co., from the Caucasus. It is intermediate between G. caucasicus and G. latifolius, and very nearly allied to G. Alleni. If Alleni is a hybrid between latifolius and caucasicus, this is probably a hybrid also, the strain of latifolius preponderating in Alleni, and of caucasicus in Perryi. They are so near in all botanical characters, that I have not attempted to give a Latin diagnosis. My description is drawn from a plant kindly sent to me by Mr. Jas. Allen, with whom it flowered this year at Shepton Mallet, the second week in February.

Bulb globose, an inch in diameter; sheaths truncate, 1½ to 2 inches long; leaves, at the flowering time much shorter than the peduncle, about 2 inches long by ½ inch broad, slightly glaucous on both sides, nearly flat, the edges not at all reflexed; peduncle slender, 5 to 6 inches long; pedicel about as long as the linear bract; ovary, green, globose, ⅛ to ⅛ inch in diameter; outer segments of the perianth oblong, very convex on the back, ⅝ to ¾ inch long; inner segments half as long, deeply emarginate at the apex, with a green horseshoe-shaped mark round the apical sinus, green inside, except at the edge, with distinct vertical white stripes; stamens much shorter than the inner segments; anthers apiculate. *J. G. Baker.*

Senecio sagittifolius.

We have previously alluded to this noble Composite, introduced from Uruguay by our excellent colleague, Ed. André. It was figured in the *Revue Horticole*, and is now offered for sale by M. Bruant, of Poitiers. The radical leaves covered with white down, measure 1 yard or more in length, and are provided with a peculiar crested outgrowth from the midrib on the upper surface. From the tuft of leaves the flower-stalk rises to a height of 7 to 8 feet, bearing at the top a loose panicle of white Aster-like flowers.

Lathyrus splendens.*

This is a perennial climbing plant, with large Pea-shaped flowers of great beauty. It is remarkable also for the variable character of the foliage, some of the leaflets being quite linear in form, whilst others are oblong. The leaflets are about eight to a leaf, the stipules small, semi-sagittate or sickle-shaped, rarely laciniate, sometimes subulate and entire. The flowers are very large, "scarlet-purple," but varying much in tint. Judging from the dried specimens, the description of the discoverer is by no means exaggerated. We have seen in the Kew Herbarium specimens from San Bernardino, Vasey! and Lower California, Pringle!

* *Lathyrus splendens*, Kellogg, in *Proc. Californian Acad. Science*, 1876, vol. 7, p. 90.

Picea Breweriana, *Watson.*

We have received seeds of this elegant weeping Spruce from Messrs. Thorburn, of New York, who are now offering seeds for sale. Messrs. Douglas, it may be remembered, undertook a journey to the Siskeyon Mountains to collect seed, and succeeded in obtaining a considerable amount, so that we may soon expect to see it in quantities. The cone was figured, and the tree described by Prof. Sargent, in our columns April 17, 1886. Its most remarkable features are its long lithe pendulous branches, like those of a Weeping Willow. The seeds measure about 1 cm. in length; in form they are obovoid, purplish, with darker spots, and surmounted by an oblique hatchet-shaped separable wing, covering the back of the seed, but leaving the other side exposed. The embryo we dissected had six cotyledons. *M. T. M.*

Magnolia salicifolia (*Maximowicz, Mel. Bio., viii.*, 509; *Sargent, in Garden and Forest, February* 8 1893, *p.* 65, *fig.* 12).

A Japanese species, new to cultivation, and of which Professor Sargent has obtained a good supply of seeds. It is described as a slender tree, 15 to 20 feet high. The bark, at first light green, becomes eventually dark reddish-brown. The ovate-acute leaves are silvery on the lower surface, and deliciously fragrant when bruised. The flowers are at present not known. It grows on Mount Hakkoda, in low wet situations.

The Market Gardens of Amiens.

The traveller from Calais to Paris by railroad will notice in the immediate neighbourhood of Amiens a large space of land devoted to market gardens. One might almost fancy them to compose a huge chess board, each square being divided by ditches, terminating at the ends in canals, those silent highways for the vegetable-laden barges. The French call these "Les Hortillonages," and they can only be visited in a small boat. No one knows when these marshes surrounding Samarobive (as Amiens was called in ancient times), were for the first time cultivated. The Latin etymology, Hortillones or Hortulini from hortus (garden) seem to indicate the residence of the Romans at the moment when the first attempt at cultivation began. In 1651 Bonneford, the author of the *Jardinier français* said, "The gardeners of Picardy well deserve to be called the most famous cultivators of all the provinces of France." M. T. Rattel has lately given to the world a book on these market gardens, and some of the details therein mentioned may prove interesting. They are divided into little islands, some a quarter-of-an-acre in size, others 1 or 1½ acres; they surround Amiens, and enclose a total space of over 1000 acres. From two thousand to two thousand five hundred gardeners are employed on the plots, which are of great value, many fetching as much as £200 an acre. Besides kitchen gardening, the land is used for the growing of fruit trees, Cherries, Plums, and Pears, the spaces in between the trees being filled with Currant bushes, which attain to great perfection. The sale of the Red Currants amounts on an average to £2400 a year, while Black Currants bring in £400. In the plots where vegetables are cultivated, there is not the slightest shrub to prevent the free access of sun and air. The English people who go to Amiens often express surprise at the amount of land given over to "salad" culture. The consumption of

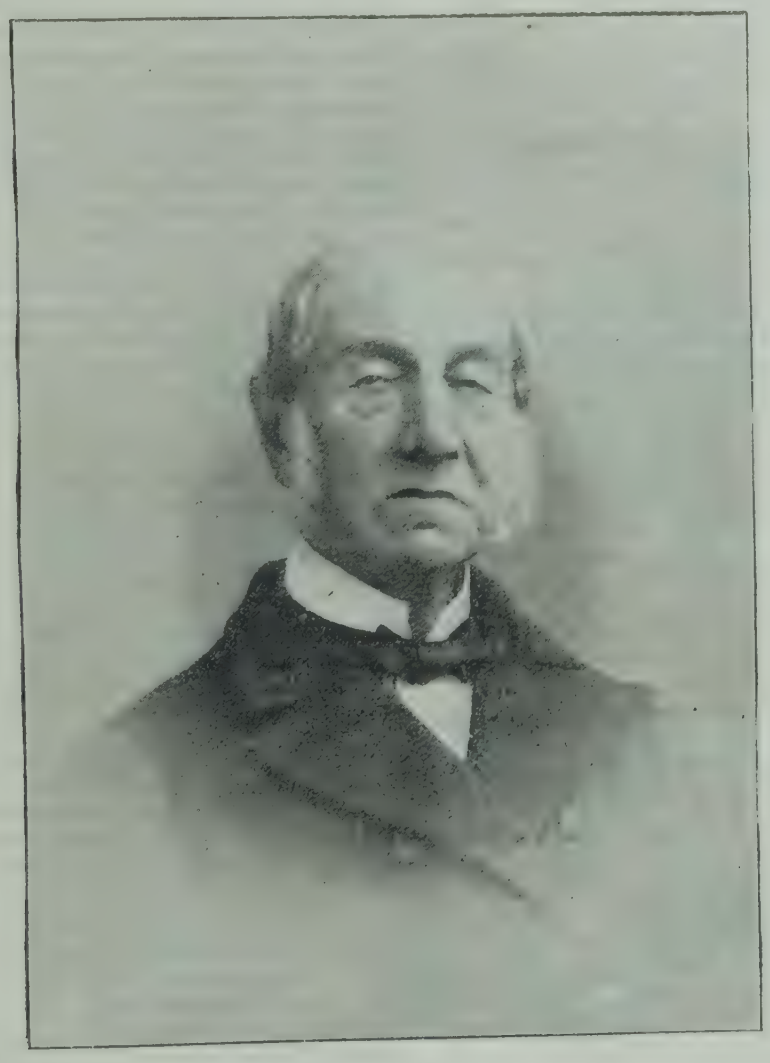
Lettuces in France is very great. Radishes and Onions are found in every plot. The market gardeners have always formed, and still do form a class apart from the rest of the community. Their mode of life isolates them completely. Up at daybreak, they loosen their boats, and soon reach their respective plots where they labour till the evening, digging, hoeing, weeding, planting, and with no distraction save their meals, and perhaps an occasional word shouted to a neighbour. It used to be the custom of these folk to wear a peculiar dress, a long blue vest with a jacket of red wool, black top boots and leggings. The last time they appeared in this fashion was on the occasion of a *fête* given by the Duchess of Berri at the inauguration of the canal of Angoulême. We learn that the picturesque appearance and the extraordinary skill with which they steered their craft (often with only a spade for an oar) excited general admiration.

Markets are held at Amiens two or three times a week on the Place Parmentier. The gardeners arrive in their boats, and mooring to the side of the quay unload their goods, and place them in orderly rows awaiting the customers. It is no unusual thing when the tide is high to see 130 of these craft lying by the quay. There is a rule of the municipal council that no goods may be carried off before five o'clock, but they do not prohibit the sale of the goods before hand. At five o'clock a bell is rung, and the real business of the day begins. All the fruit and vegetables which but a few moments ago were lying in orderly rows are now being rapidly transferred to the carts of the greengrocers and fruiterers of the town. Many economical householders may be seen with their baskets, intent on their purchases, even at this early hour.

The scene is a lively and animated one, and the majestic cathedral in the background lends a singular charm to the whole. On certain days as much as £2000 worth of produce is sold. In 1833 the Mayor computed the sales thus:—In spring, £10,000; in summer, £10 000; in autumn, £5000; in winter, £5000. That the prices realised to-day many times exceed these computations may be seen by the fact that on some days (as mentioned above) £2000 is often taken. *H. C. F.* [These gardens were figured in our issue for January 19, 1884. Ed.]

JOHN LEE.

John Lee is the honoured representative of a firm distinguished in the annals of horticulture, and, like himself, still in vigorous existence. The history of the firm has been given in our columns on more than one occasion, suffice it to recall to the memory of our readers that the founder of the firm was the correspondent of Linnæus, and the translator and adapter of one of his works. The story of the introduction of the Fuchsia is also a well-known incident in connection with the firm, and which is frequently repeated in the columns of the lay press. For many years the firm was represented by the brothers John and Charles Lee; then John, the elder brother, retired, but on the sudden death of Charles, he bravely returned to the scene of his labours, though then at an age when most men seek repose, and came to the aid of his nephew, the present proprietor. Vast are the changes that have occurred in the horticultural world during the long life of Mr. John Lee. The Heaths, the Proteas, the New Holland plants, for which the firm was once so famous, are well-nigh deposed in favour of other favourites; but throughout all the mutations of fashion and the changes of business, John Lee has maintained his youthful interest, not in one, but we may say in all branches of horticulture. He was at one time on the Council of the Royal Horticultural Society, and presided for several years over the Horticultural Club, a position for which his unique experience, his tact, and geniality rendered him specially suited. Rarely is there a gathering of horticulturists in the metropolis but is enriched by the presence of Mr. Lee. His retentive memory, his keen interest and sympathy with all matters relating to horticulture, secure for him the respect of all his colleagues, whilst his personal qualities endear him to all who have the privilege of his friendship.



JOHN LEE

KEW NOTES.

Anthurium Chamberlaini.—This fine plant was figured and described by Dr. Masters in the *Gardeners' Chronicle*, pp. 464, 465, vol. iii., n.s., from a specimen in the collection of the Right Hon. J. Chamberlain, M.P., at Highbury, Birmingham, where it has formed for many years a conspicuous feature in the conservatory. An offset from this, the only plant known, was presented by Mr. Chamberlain to Kew last year, and is now flowering in the T Range. It has shining heart-shaped leaves, the sinus unusually broad, and the apex tapering, the largest leaves 2 feet long on stalks 4 feet long. The inflorescence is composed of a broad, boat-shaped spathe, coloured coppery-red inside, tinged with green outside, and a thick curved spadix covered with dull purple flowers. The Kew plant is smaller both in leaf and flower than the parent described by Dr. Masters, which had leaves 3 feet long, and flowers 8 inches by 4 inches on a peduncle 1 foot long. It was introduced by chance on an imported plant of Cattleya Gaskelliana. A figure of it has been prepared for publication in the *Botanical Magazine*.

Hydnophytum.

A new species of this remarkable genus of Rubiaceæ was sent to Kew from the Botanical Gardens, Fiji, two years ago under the name of Myrmecodia vitiensis. One of the plants has lately flowered, and has been figured for the *Botanical Magazine*. This makes the third species of these epiphytic Rubiaceæ which have been introduced and flowered at Kew within the last seven years. The first was Myrmecodia Beccari (*Botanical Magazine*, t. 6883), described by Sir Joseph Hooker as one of the most singular plants ever imported in a living state into this country. It belongs to a group of genera which have long been known for their singular habit of forming often spinous tubers (swollen stems) of great size, the interior of which is galleried by ants. There are four genera known to possess this character, and they comprise some fifty species, all natives of tropical Asia, chiefly Malaya and New Guinea. They have no attractions in their flowers or leaves, but as members of the same natural order as Cinchona and Ixora they are really very remarkable plants; and in the fact of their galleried stems being the abodes of peculiar species of ants, they are a source of interest to naturalists generally.

Musa rosacea.

This is a handsome plant at all times, and specially so when in flower. It is smaller than the forms of M. sapientum, cultivated for their fruits, the strongest stems attaining only about 10 feet in height before developing an erect spike, clothed with large ovate rosy-purple bracts and yellow flowers. The fruits are rarely ripened, and when they do mature, they are of no value. There is a plant of this species in flower in the Palm-house, and there are also several groups of it in the beds among the large Palms. The smaller species of Musa are much more attractive when in flower than the larger kinds. For instance, M. coccinea, a Chinese species never exceeding 5 feet in height, has conspicuous erect spikes of bracts coloured cardinal-red and yellow tubular flowers; M. sanguinea is of similar stature, and is almost as handsome. There are also several species with variegated foliage, such as M. zebrina and M. discolor. These smaller Musas are most effective when mixed with Palms, Dracænas, Crotons, and other popular stove plants; but they are very rarely grown, except in botanical gardens.

ON THE GROWTH OF ASPARAGUS.

If the object of the gardener is to grow maximum crops of Asparagus, he must in some way furnish the plants with nitrogenous food, phosphates and potash, these constituents being in most demand for the successful growth of the crop. Asparagus is sold by the bunch, and the price ranges according to

earliness and quality. It is far easier to sell a good crop than a poor one, or even one of medium quality. The demand for the large tender shoots is so great that the market gardener often uses his fine bunches of Asparagus to sell the rest of his load. The following table shows the chemical composition of 1000 lb. of fresh Asparagus as gathered:—

	lb.
Water	929·7
Organic constituents	60·6
Nitrogen	3·7
Ash	6·0
Total	1000·0

The composition of this 6 lb. of ash is made up as follows:—

	lb.
Potash	3·02
Soda	0·07
Lime	0·26
Magnesia	0·23
Iron oxide	0·06
Phosphoric acid	1·31
Sulphuric acid	0·47
Chlorine	0·51
Silica	0·07
Total	6·00

From these figures we learn that one ton of Asparagus would, during its growth, remove from the soil, of potash 6·8 pounds, of phosphoric acid 2·9 pounds, and of nitrogen 8·3 pounds. An average crop of Asparagus may be reckoned at four tons per acre, which would remove from the soil during growth, say, in round numbers, potash 27 pounds, phosphoric acid 12 pounds, and nitrogen 33 pounds.

In order that we may get quick and vigorous growth, it is necessary that the plants be provided with their food in a readily assimilable form. With few exceptions all the artificial manures of mixed composition now generally sold, in proportion to the wants of plants, contain a larger proportion of phosphoric acid, potash, &c., than they do of available nitrogen, owing to the expensiveness of this latter element.

If we desire to raise maximum crops of Asparagus of first quality, we must therefore furnish the plants with available nitrogen. The cheapest and best form in which we can do so, is doubtless in nitrate of soda, as nitrate acts in most soils more quickly and powerfully than any other manure or fertiliser in the market.

The following mixture is recommended, as supplying the manurial ingredients necessary for the growth of good crops of Asparagus:—

Kainit salt	3	cwt. per acre.
Superphosphate of lime	2	,, ,,
Nitrate of soda	1½	,, ,,

The value and necessity of superphosphate for the Asparagus crop is shown in the analyses, by the quantity of phosphoric acid, sulphuric acid and lime contained in the ashes of the plants when burnt.

The kainit salt will not only supply the necessary potash, but will at the same time furnish magnesia and chlorine, two other of the constituents of the Asparagus plant.

The manure should be mixed together and sown broadcast over the beds when they are finally made up in the spring. To those who are using ordinary farm-yard or stable manure we say, continue to use it, but try to make it more available for plant-food by the addition of some other, and more quickly acting medium. *J. J. Willis, Harpenden.*

GARDEN PALMS.

(*Continued from p. 692, vol. ix.*)

Pinanga, Blume.—A genus of about twenty-four species, all natives of tropical Asia, extending from the East Himalaya to Borneo. They have slender erect unarmed Bamboo-like stems, varying in height from a few feet (P. Veitchii and P. maculata) to 20 or 30, or even 50 feet (P. Manii). Some of the species have solitary stems, but the majority appear to be soboliferous or tufted. The leaves are unarmed, pinnate, generally irregularly divided, sometimes merely bilobed. They are small for Palm leaves, and in some of the species they are variegated or mottled. The flowers are produced on drooping branched spadices below the head of leaves, male and female flowers together, the stalks being usually red or orange-coloured. The fruit is egg-shaped or round, less than an inch in diameter, with a fibrous husk, which is brightly coloured, usually yellow or orange-red when fresh. The seeds have ruminated albumen. Seedling leaves bifurcate.

The genus has not long been cultivated in Europe. It is not included in the list of Palms cultivated at Kew between 1760 and 1864, published in Smith's *Records of Kew*, and although several species have since been introduced and brought prominently under notice, they have not found much favour with horticulturists. This is probably due to their requiring a decidedly tropical temperature and plenty of moisture all the year round. P. maculata appears to have been in cultivation in Belgium in 1863. P. Veitchii, collected in North Borneo by Mr. Burbidge in 1877, and distributed in 1880 by Messrs. J. Veitch & Sons, is a very pretty little Palm, with short tufted stems and elegant bilobed leaves, coloured rich green, blotched and shaded with bronzy-brown. It failed, however, as a garden plant, and I am not aware of a single example of it in cultivation now. P. maculata, P. malaiana, and several others have mottled foliage, especially when young.

The species represented at Kew, named below, are not without attractions at any time, some of them when in flower being quite ornamental, the flower-stalks are bright red or yellow, the seeds also, when they mature, assuming a bright colour. P. Dicksoni, which was liberally distributed from Kew a few years ago, and which is also known as Areca and Seaforthia, is evidently a free grower, with yellowish-green leaf-stalks, bright green blades, and graceful in outline. It ultimately forms a tree 20 or more feet high, with a solitary stem 2 inches in diameter.

P. coronata, Blume, Java.
P. Dicksoni, Blume, India.
P. disticha, Blume, Penang.
P. decora, Hort.
P. Kuhlii, Blume, Sumatra, Java, &c.
P. latisecta, Blume, Sumatra.
P. maculata, Porte, Philippines.
P. malaiana, Scheff., Penang, Malacca.
P. paradoxa, Scheff., Malacca.
P. patula, Blume, Sumatra, *Botanical Magazine*, t. 6581.
P. Sanderiana, Hort., Sander (1885).
P. Smithii, Hort. (recently flowered in the Palm-house at Kew).
P. spectabilis, Hort., Bull (1886).
P. ternatensis, Scheff., Moluccas.
P. Von Mohli, Hort., Linden (1890).

The garden plants in this list marked Hort. may belong to one or other of the species already described by botanists; they are not included in the total number of species given above. P. rubricaulis, of Linden, may be the "red-stemmed Palm," Cyrtostachys Renda, which is very like a Pinanga in habit and foliage, but is remarkable for the rich orange-red of its leaf-stalks and stems. *W. W.*

(*To be continued.*)

A TRAVELLER'S NOTES.

(*Continued from p. 230.*)

Canton.—Canton is eight hours' journey from Hong-Kong, up the Pearl River—a large stream, sometimes with hilly, and sometimes with flat banks, where Rice is cultivated. The approach to Canton is very curious, on account of the immense number of small and large "sampans" and "junks," usually arranged in lines, forming complete streets. It is estimated that 300,000 human beings have their home in this enormous fleet, and have never had a house on shore.

Canton is exceedingly interesting. One is forced to have a guide, or risk being hopelessly lost in a very few minutes, as the streets—varying in width from 6 to 12 feet (they usually average 10 feet)—form a most bewildering maze. These narrow lanes are paved with large slabs of stone, often very uneven and very dirty. I arrived in Canton during a heavy rain, which lay about the streets just as it fell. All are very dark, on account of the innumerable long signs—usually in scarlet and gold—hanging from the higher stories. Often in looking up, all to be seen is a thin streak of light; some are entirely roofed in. On each side are shops, usually very neat and clean, and entirely open to the street, each shop being usually its own factory, where one could see the articles for sale being produced. The only way to get about in these narrow, thickly-crowded lanes is in a chair borne on the back of three coolies, and always getting out to see anything. One can enter any shop, and be courteously received; amongst the most interesting are the silk and Jade stores.

Canton has over 1,000,000 inhabitants, and the huge wall surrounding it, 15 to 25 feet wide, is 6 miles in circuit; the whole being filled up with a maze of narrow lanes as described. The place is full of temples, every street has an altar, and every shop and house a niche, in front of which is a bundle of burnt and half-burnt joss-sticks.

The best temples are the Temple of the 500 Genii and the Temple of Horrors. The former comprising many courtyards, huge guardian images, pavilions, and a small pagoda is the most visited. In the centre hall, arranged in aisles, are the 500 images, life-size, no two alike, in a sitting position, and all richly gilt. Much money is spent when the idols, watched over by seventy priests, are appealed to on certain great occasions. The courtyards of this temple were almost deserted, affording a striking contrast to the large one in front of the Temple of Horrors, so-named from its large plaster groups of almost life-size figures representing the mode of inflicting and the variety of punishments in the Buddhist Hell.

The courtyard of this temple is thronged with a most motley lot of riff-raff, gamblers, fortune-tellers, pedlars, quacks, &c., the noise being deafening. The gambling is usually for coins called cash, 100 of which are equal to 7*d.*

The famous Examination Hall containing 11,616 cells, is not a hall at all, but a huge courtyard flanked on either side by rows of cells 5½ feet by 3⅔ feet, in which, with a wooden board for a bed, the students are locked until the time allotted for answering a paper has elapsed. The examination occupies three sessions, of three days each, and only about 130 are passed for government service.

The execution ground, used as a potter's field, is a small triangular piece of ground, only 75 feet by 25 feet at the widest end. The average number of annual beheadings (an operation performed with great celerity and dexterity) is 300, in batches of ten to twenty at a time.

Against the wall lean several wooden crosses, on which females and offenders of the worst description are tied and put to death with attendant horrors.

I also visited a species of police court, that created much interest. A row of minor officials, little boys and hangers-on, collected in front, and discussed "the red-headed barbarian;" the texture of my overcoat was examined, and I was gratified to notice, that it was apparently approved of.

On my arrival the Court was not sitting. In a yard, the lower end of which was roofed over, were three small wooden tables, with two chairs on each side. On a bench lolled, what appeared to be minor officials; against two posts squatted two wretched unkempt heavily chained animal-like looking men, whilst a third was huddled up in a basket, having had to be carried into the place. After waiting some time, four more or less richly-dressed men appeared and seated themselves at the tables. One of the prisoners was led forward and grovelled on his knees. He was cross-examined (witnesses are, I believe, unknown), but refused to answer, so was tied on a form by his big toes, thumbs, and pigtail, and placed against a post resting on his knees alone to think it over. The position was uncomfortable, but to Chinese coolies certainly not torture; what they can stand without flinching or uttering a sound is extraordinary. Another prisoner was then led forward, and his cross-examination began, the one in the basket being asleep all the while, the whole thing evidently rather boring him than otherwise. The high officials now had refreshment; plates of little sweets and hot tea, after which they smoked a kind of double-barrelled metal pipe, refilled by a servant for every puff, one filling of tobacco only giving one puff of smoke.

The two prisoners under examination were, I am told, accused of burning twenty houses, and killing three people. The system pursued is to get them to confess under the bastinado, hitting on the jaws with heavy flaps (all of which hang on the court-wall,

ready for immediate use), or some other torture, and then by cross-examination, either to break down or support the confession.

Situated at one end of the town on the city wall is the five-storeyed pagoda. It is reached by the same narrow lanes, which in this quarter smell to such an extent as to be absolutely painful. From the top of the pagoda a fine view of the hilly country beyond is obtained, those hills immediately under the walls being honeycombed with thousands of graves, small stones marking the spot where the poor are laid, whilst large tiers of semicircular brick-work with gaudy lettering, much resembling the entrance to a railway tunnel, denote the burial-places of the rich and the great.

Fig. 37.—CHINESE WATER-TEMPLE.

Hearing there were some gardens on the opposite bank of the river, I went across and visited three. The impossibility of being understood (for the guide, as in India, knows but very little English) was a drawback. These gardens have only plants in pots—large porcelain, variously-coloured (usually a shade of blue) jars, filled with stiff lumps of blackish earth, quite wet. I could not find out where this came from. The porcelain jars are arranged on stages, one row above the other, for about four to five rows. The most interesting thing I saw, and it was really clever, was the training of a small thick-growing (Ligustrum sinense) Privet-like looking plant into various shapes—such as men, women, fish, dragons, sampans—the hands, feet, heads, and,

in the case of animals, eyes being constructed in porcelain in a most realistic manner, and inserted or attached to the figure in an equally ingenious manner. Everything was in proportion, the work must have taken considerable time, and the plant is rather old. They usually varied from 2 to 3 feet in height. Bamboos were trained in zig-zag fashion. I did not notice any other system of training.

Camellias, low bushes, in flower, or covered with bud, were largely represented, as were also Hydrangeas, foliage Begonias, Euphorbia sanguinea in flower, Nasturtiums, low-growing Dahlias, Lonicera japonica, Tagetes, a small single purple Malva, flowering freely; Poinsettias, in bad condition—too cold just now, I think; Oranges, China Roses, nice dwarf bushy plants, flowering well; a single red and a purple Azalea; one species of red Dracæna, and very many Tree Pæonies—strong clumps which, when they had not a flower-bud, were huddled together, one on the top of the other in confusion. If they had a flower-bud, they were removed to a stage, and looked after, a dollar being asked for each plant. Whether this was "white man's" price or not, I cannot say, and could not bargain, as I did not mean to buy. I saw three only in flower out of several hundred—they were not remarkable. I also saw a fine piece of Magnolia Soulangeana nigra bearing many flowers, and several dozen flowering pots of Phaius (Bletia) hyacinthina. *J. H. Veitch.*

(To be continued.)

SELECT DECORATIVE FOLIAGE PLANTS.

(Continued from p. 134.)

Aralias.—The slender-growing species are very elegant subjects for table decoration. A. Veitchi, A. V. gracillima, A. elegantissima, and A. leptophylla are the most useful. A. reginæ may also be included, but this is not often met with. All of the above are rather difficult to propagate, and the only reliable method is to graft them. A. reticulata is the best stock though sometimes A. Guilfoylei is used; both of these may easily be propagated from cuttings. When A. reticulata is used, the tops cut off will make good cuttings for a succession. The grafts should be put on the stocks as close to the base as possible; the operation must be performed very carefully, and they will also require attention afterwards. Keep them in the close propagating pit until united, and give but little moisture. These Aralias should all be potted in light peaty compost; it is better not to treat them too liberally, or they grow out of character, and lose that elegance which is their great attraction. They are usually grown in a stove temperature, but I have seen them in a flourishing condition growing among new Holland plants in a cool greenhouse. A few years ago I saw a large plant of A. Veitchi in the greenhouse at Pendel Court. It was planted out, and had made such vigorous growth that one could hardly identify it with the slender-growing plants usually seen.

A. Kerchoveana is a distinct and useful species; it is of more vigorous growth than those referred to above; the leaves are larger, and the leaflets broader, and of a pale green. It may be propagated from cuttings. Tops about 3 or 4 inches long, taken off and put into small pots, will root freely in the stove propagating pit. Light sandy compost should be used, with a little extra sand at base of cuttings. This Aralia must be grown in the stove; and if the temperature falls very low, the leaflets drop off, as do those of A. filicifolia, another distinct and useful species, which requires treatment similar to the above. For summer decorations they are very useful, but should not be used during the cold winter weather.

Aralia Chabrieri (Elæodendron orientale) makes a fine plant either for the table or as a larger specimen. Erect in growth with horizontal branches, the long narrow leaves, which are of a dark metallic green, give the branches the appearance of pinnate leaves. It may be propagated from cuttings; if side shoots are taken they will grow horizontally for some time, but eventually they will break at the bend—and after this is well started, the long horizontal growth may be cut away, and a good plant will soon be established. This will succeed well under the same treatment as A. Veitchi, and though requiring stove treatment, it will last well when used for indoor decoration.

Aralia Sieboldi has now become one of our most popular plants for market work, and it is one of our most useful plants for indoor decoration; it will last quite as well as Ficus elastica. Although hardy, it is only when grown under glass that it makes a really useful plant, or, at the most, it should only remain outside during the summer-time, for the first autumn frost will nip the young leaves. This Aralia is grown from seed. The main supply of which is obtained from the Continent, though it is sometimes ripened in this country. The imported seed generally arrives in April, and as it soon loses its vitality, it should be sown as soon as received. The seed-pots may remain in warmth until the seed has germinated, and the young plants should be potted singly as soon as large enough to handle. In growing the plants on, they require plenty of light and air, and they must not be crowded. A good loamy compost should be used, and the plants potted moderately firm. Under favourable treatment, seedlings will make useful plants in about a year. The variegated variety is also useful, but is not much grown in this country, most of the plants being imported from the Continent. It is only from cuttings or grafting that this can be propagated, and it takes a long time to get much stock, as it does not branch out freely. Under favourable conditions, it makes a fine plant, and the variegation is distinct, but when grown under the shade of other plants, or in too much warmth, it is anything but attractive. *O.*

The Week's Work.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

STOVE PLANTS.—Caladium tubers may now be potted, using for them well-drained clean pots, and loam, peat, and leaf-mould in about equal ratio, with plenty of rough sand. After potting, afford them a light place in the stove, and if they can have bottom-heat, it will be the better for them. Keep the soil rather dry till a start is made. Caladium argyrites is one that is best grown in small pots, it is then a very useful subject for table decoration. Strike cuttings of Gardenia Fortunei radicans and G. florida intermedia, Francisceas, Ixoras, and Tabernæmontana under hand or bell-glasses in a bottom-heat of about 80°. Young plants of the above which are growing in small pots should be potted into larger ones in a mixture of peat and leaf-mould, with a small quantity of turfy loam and plenty of sand; Tabernæmontana coronaria, fl.-pl., is as useful as a Gardenia, and in the same way, besides being easier cultivated; flowers white, and very sweet. With increasing daylight, the temperature of the stove may be raised to 80° by day, and by night to 70°, and the plants syringed twice daily, and moisture distributed freely about the house, so as to keep red-spider and thrips in check. All shading materials should now be put in order in readiness for stove and fernery. For the Camellia-house and the conservatory, summer-cloud shading is excellent, and looks neat if it is put on in wavy lines. Newly-potted Ferns in span-roofed houses or in those facing south will require a little shade from now onwards. Adiantum cuneatum required for cutting purposes should be grown in the light without shade.

TREE CARNATIONS.—Keep these plants free from green-fly by fumigation. Cuttings of these will strike well in heat at this season, and make fairly strong plants, but plants from layers taken later on will be still better and stronger. Stir the surface of the soil and top-dress the old plants, keeping the shoots neatly tied up to small sticks. Afford well-rooted plants diluted manure-water, or a pinch of some artificial manure to each pot. Young stock pot on, using good loam, leaf-mould, and small quantity of manure.

GREENHOUSE PLANTS.—Plants of Azalea indica which have been forced for bloom and are now past, should have all the flower-stalks removed and be placed in a temperature of 60° by night and 70° by day to make growth, well syringing them twice daily, and shutting up the house at 3 p.m. Those which require repotting should have attention, using good fibrous peat with a small quantity of light loam, and leaf-mould, and plenty of sand. The pots should be quite clean and well-drained, and the potting done firmly, but the soil should not be hammered hard so as to injure the tender roots. Remember to water them before re-potting, and pay great attention to watering afterwards; keep the soil slightly higher at the sides of the pots, to allow the old ball of roots to become thoroughly soaked with water when required.

ACACIAS.—These are among the most useful plants for the greenhouse, halls, or corridors. They may also be grown against pillars or on rafters in the conservatory. Some species are deliciously scented. With a little heat, Acacias may be had in flower at any time during the spring months; they are easy to cultivate, and as a potting or border soil, they like good loam and peat in about equal parts, with plenty of sand. Cuttings strike very well in a gentle bottom heat, but most of the varieties may be obtained from seeds, which, if sown now in heat, soon germinate, if previously soaked in water. Good species are A. cochlearis, A. dealbata, A. grandis, A. verticilliata, and A. longifolia.

THE APIARY.

By Expert.

SEASONABLE HINTS.—Bees have been giving abundant proof that breeding has commenced in earnest, as they have been taking in water and pollen very freely during the latter part of the past month. Several days were so fine and mild that it was quite safe to open the hives for the purpose of ascertaining the amount of stores, searching for eggs, or uniting queenless stocks. It is too early at present to give syrup for stimulating purposes, the weather not being uniformly warm enough yet for the bees to take syrup. Therefore, the proper kind of food is sugar-candy mixed with pea-flour, which may be placed over the cluster. Many bee-keepers do not trouble about spring stimulative feeding, preferring to arrange that their stocks are packed up strong in the autumn, and provisioned with sufficient food to carry them right through the following winter and spring. If this let-alone system is properly carried out, it is doubtless the best and most natural one, and saves the bee-keeper a great deal of trouble in the making and distributing of syrup in the spring. In districts where early flowers are scarce, it is doubtless conducive to continuous breeding to provide nitrogenous food in the form of pea-flower. This can be mixed with chaff, and put in a covered box, which should be put in a warm and sheltered corner near the hives. To enable the bees to find it out, if a little piece of comb containing honey be put in as well it will soon attract them. Water also should be provided where there is none near the apiary, as much is required at this season for thinning the honey that is used for feeding the brood. The value of alighting-boards, reaching from the ground to the hive, is more noticeable during March winds than perhaps at any other time, and the lives of many bees are saved by using them. If the ground, too, in front of the hives is kept strewn with ashes, sawdust, or any material of a like nature that will have the effect of keeping the surface warmer and drier, it will have a beneficial effect by saving the lives of numerous workers.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

GLADIOLUS.—The Gladiolus is raised from seed without difficulty, and from brood or spawn which is found clustered round the flowering corms or on the roots at the end of the season. The seed may be sown at the present time in large pans or pots, placed in a greenhouse or warm pit, the seedlings being thinned when they appear above ground, and the rest allowed to remain the first season in the pans, &c., in which the seed was sown. A light position and abundant ventilation should be afforded during the early summer months, in order to fit them for being placed out-of-doors in June. If the plants are well looked after during the growing season, not allowing them to lack water whilst in full growth, and gradually ripening them off in the autumn by withholding water by degrees, a good many of them will flower the next year. The only way to increase the stock of any particular variety or varieties is by means of the bulbils, which should be separated from the corms intended for flowering, and planted in lines a few inches apart, at a distance of 6 inches between the lines, in a warm,

rich border any time during the next few weeks. If looked after during the summer, and afforded plenty of water when the weather is hot, many of them will become sufficiently strong to flower the second year. To attain the best results with Gladiolus, a deep rich soil, and a sheltered sunny position should be selected. On no account should fresh manure be used at planting time, this tending to cause decay in the corms, should they come in contact with it before growth commences. The corms of Gladiolus Brenchleyensis, G. ramosus, G. "The Bride," or G. Colvilli, may now be planted, as if left out of the ground much longer they are likely to shrivel and lose much of their vitality, especially the last-named. The planting of the choice varieties of G. Gandavensis should commence in the second week in March, and be continued at intervals till nearly the end of the month of May, thus lengthening the flowering season. If very early blooms are required, the roots should now be potted and placed in a frame or pit from which frost is excluded, subsequently planting them out-of-doors when all danger from spring frost is past. Gladiolus corms should not be deeper in the soil than 3 inches, and if they are in masses, 1 foot is sufficiently wide apart. Groups of four or five roots in the space of 1 square foot in mixed borders or shrubberies look well. Each root, when planted, should be provided with a neat stake to which to tie the flower-shaft. In hot and dry weather, water should be freely afforded; and a thick mulching of short manure is beneficial.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

NEWLY-PLANTED RASPBERRIES.—The pruning of canes should be performed forthwith, the length of canes to be left being determined by their strength, the stronger the longer as a rule; and as no fruit need be expected the first season, the strength of the plant should be utilised in the production of fine canes for next year. Some canes may be cut down to 6 inches from the soil in the case of the weakest, and at 18 inches in that of the strongest. Where stakes were put in to which the canes were fastened to avert injury by wind-waving, these may still be retained, and the young canes secured to them in time.

BUSHES AND TREES.—The ground being moist, the present is a good time to place stakes to all bushes, pyramids, and standard trees requiring them. The stakes should be strong ones, of Oak, Ash, or Hazel, in the case of young trees, whilst forked props may be necessary in the case of older trees, which may have got out of the perpendicular; and with these a soft and ample pad should be placed between the prop and the bark. For small trees, worn-out india-rubber garden hose may be used to protect the bark from being rubbed, and of several thicknesses as may be found necessary.

COBS AND FILBERTS.—No garden is complete without a few Nut-bushes, and no other kind of fruit gives such good return for the small amount of labour expended in its cultivation. The bushes should have clear stems of from 15 inches to 3 feet, according to the position they occupy, or the form of the heads, the latter height being suitable for bushes on turf. The root-suckers should be persistently removed. Nut-bushes grow well in strong loam, or even in clay, and where the soil is light or gravelly, a top-dressing of heavy clayey soil has a good effect on them. Nut-bushes require the same annual pruning as other fruits, and unless they are becoming too large for their position, thin out only the small and weak branches, so as to admit sunlight to the inner parts of the bush, as only those nuts which benefit fully from direct sunlight keep plump and fresh throughout the winter. Nut bushes being now in bloom, it will be seen if the blossom be scarce; and if that is the case, not much of it should be pruned away.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

THE CATTLEYA-HOUSE.—Cattleya Aclandiæ, C. superba, C. Schilleriana, and C. Schroderiana, now starting into new growth, require to be placed at the warmer end of this house, after their rest of four or five months. During the rest, water will have been very sparingly applied, say, once a fortnight, and the pots or baskets hung close to the roof. The plants now showing signs of activity, and which may want some additional or new compost should be taken in hand forthwith; also those which stand in need of more roomy baskets. I think that it is a good method to pick out the old compost, then wash away all earthy matter before transferring the plant to a new basket. Doing it in this way is safer than pulling the plant out of the material if old established. The new basket should be large enough to allow of a small quantity of new peat, moss and clean crocks being used. These species of Cattleya, dislike a great mass of material about their roots. C. Aclandiæ prefers and does better on small Teakwood-rafts, with just sufficient moss in which to bed them, fastening the root-stock with copper-wire. With regard to plants on rafts, it is better to make new ones and place the old on these, than to tear the plants off the old ones. I find that these species are more successfully grown in this manner, and if they are also hung close to the roof on the south side. The temperature most suitable for these plants, now that they have started, is 68° to 70°, say, 5° higher than during rest, with more water afforded, and a moister state of the house in which they are standing. Cattleya calummata×, and Lælia elegans and its superb forms, L. Jongheana and L. Philbrickiana×, require the same kind of treatment as that recommended above, and all of them should be grown in baskets, with a plentiful supply of water at the roots; that is, watering them thoroughly when water is required. The air should be kept moist by damping down, &c. Cattleya Gaskelliana and C. G. alba will require more water now that new growths are showing. These species having been rested at the cool end of this house for the last four months, should have a warmer place found for them. Lælia Perrini is another that must be seen to, as its time for starting has now arrived; it is a useful species, coming into flower about August. Attend to the requirements of C. Warneri and C. maxima, now in full growth, avoiding any check from lack of water, which would cause very short bulbs, without flower-sheaths, which, instead of flowering, would probably start new growth.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

MUSHROOM-HOUSE.—Procure materials, and prepare them for replacing exhausted beds. In a properly situated and built Mushroom-house, Mushroom growing can be carried on the whole year. During the mild weather of late but little artificial heat has been needed, and the air of the house has not been dry, consequently there has been less water required by the beds, or distributed on the paths, &c., and the production of fine solid Mushrooms has been easy. In outhouses or sheds where Mushrooms have sometimes to be grown, the beds should be made thicker than in a Mushroom-house. The stable litter and manure should have the longest straw shaken out of it, and be well turned; and before it is made up into beds, and if it be dry it may need to be watered. If an open shed is at liberty, spread the materials on the floor lightly, about 1 foot thick. They will then heat regularly, and evenly, and should be turned twice a week. Beds in bearing in sheds or out-of-doors must be closely covered with long litter and mats to preserve the heat within them; and such beds should not be uncovered entirely when gathering the crop, but piecemeal, covering and uncovering as the search proceeds. In houses were but little fire-heat is used, the beds are better left uncovered after Mushrooms begin to appear. Do not use cold water, even to sprinkle the beds, or the running of the spawn may be checked. Keep the place fairly moist; sometimes the steam from a number of new beds still uncovered with soil is enough for this purpose.

GLOBE ARTICHOKES.—Offsets that were rooted in pots at the beginning of the year may now be put into cold frames to harden off, previous to being planted out early in the month of April. Should there be signs of their becoming pot-bound before that time, shift them into pots one size larger.

PEAS.—Special attention is needed for this crop, so as to maintain a constant supply. As there are now so many fine cropping varieties, there is no necessity for growing those that are second-rate; but to grow Peas to perfection, the land must be well tilled, and the plants liberally treated. I do not advocate the taking out of trenches for them as for Celery, as, if the ground is properly dug and manured, there is no necessity for this, although on thin soils the practice may be necessary. All our ground is dug 2 feet deep for every crop, and we never suffer in a dry summer. If trenches are taken out, they should be at least two spits wide, so that the roots may not be confined in a too limited space. Some decayed manure should be put into the bottom, to preserve moisture, and afford plant-food. In sowing, due regard must be given to the variety and the time of the year. If large wrinkled Peas are sown in the open quarters at the beginning of March, without protection, the seed should be sown much thicker than is the case where the rows are covered with glass, for seed which was imperfectly ripened will not germinate so freely as other, and on that account the seed is liable to rot, if the land be wet. I would recommend 1½ pint of seed to a row 20 yards long at this time of the year, when no protection is given, and three-quarters of a pint if covered. A month later the latter quantity will suffice for a similar row sown in the open. Nothing is gained by sowing too thickly, and ample space also should be allowed between the rows. I prefer a width of 7 feet, which allows for two rows of some dwarf crop being grown between, which will be off the ground in time to plant Celery, &c. In drawing the drills make them 6 inches wide and 4 inches deep, but do not cover the seed with more than 1 inch of soil if it be heavy. It will be better to cover the seed now with some fresh light soil.

FRUITS UNDER GLASS.

By Jas. Whitton, *Gardener, Glamis Castle, Glamis, N.B.*

VINES.—Where the Grapes in the early houses are fairly set, it is time to begin thinning the bunches, as once the berries are of the size of Sweet Peas, the work must be pushed on vigorously, thinning being more difficult and tedious when they get larger than this, besides the greater liability to injure the berries, and to waste the energies of the Vines. Few operations are more puzzling to beginners than Grape-thinning, and while it is very difficult on paper to direct how to thin Grapes properly, as it requires a knowledge of the variety and some practice to do the operation successfully, a few general hints may be given. Each variety must be treated according to its character; for example, those with short and stiff footstalks and compactly-formed bunches, such are Lady Downes and the Muscadines, do not yield so much during swelling of berries as those of looser build and longer footstalks do, taking Hamburgh as the type. Therefore the necessity of studying the peculiarities and treatment of each variety is obvious. A neat light stick about 1 foot in length is handy to support and steady the bunch. With a pair of clean Grape scissors begin at the point of the bunch, cutting out all small berries and most of the inner ones in the bunches; when so doing, one readily learns and discerns which are the best placed and most suitable berries to leave, to form a handsome bunch. Leave sufficient space for each berry to develop properly. Black Hamburgh requires about an inch; smaller berried sorts, of course, require less than this space. When at work, take great care not to rub the berries either with the hand or the scissors; in fact, from the time the Grapes form until they are eaten, they should not be touched in any way more than necessary. When thinning is finished, give the borders a dressing of superphosphate of lime, and a thorough watering if required. The pinching and tying of shoots must also be regularly attended to. Keep the temperature at night from 65° to 70°, until stoning is well forward, then push them on a little faster with slightly higher temperatures.

YOUNG POT-VINES.—Those intended for fruiting next year, and cut back and started early, will now be ready to move into fruiting pots. Before doing so, see that the balls of soil are thoroughly moistened, and the potting material warmed to the same temperature as the house in which they have been growing. Shift them carefully, without disturbing any more roots than is necessary to clear the ball of crocking materials. Pot them firmly. If the soil is in proper condition, they will not require watering for some days after potting. A light shading and syringing, with attention to atmospheric moisture, will keep them right until the roots begin to recover any injury sustained in moving, and take to the new soil. The Vines' eyes put in during January will now be starting, and until they make root-growth will require very careful treatment, especially in watering. If the soil gets sodden, count on failure. Where the pots or turves are on a bed of bottom-heat, with a suitable temperature in house, a slight dewing with the syringe is all they will require. Do not pot them until the roots are running freely around the sides of pot, and the top-growth is extending quickly.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

PLANTS, &c., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

NEWSPAPERS.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

WEDNESDAY, MAR. 8—East Anglian Horticultural Club.
SATURDAY, MAR. 11—Royal Botanic Society.

SHOW.

WEDNESDAY, MAR. 8—Reading Spring Flower Show.

SALES.

MONDAY, MAR. 6—Japanese Iris, Hardy Plants, Begonias, and Gladiolus, at Protheroe & Morris' Rooms.

TUESDAY, MAR. 7—Japanese and other Lilies, Gloxinias, &c., at Protheroe & Morris' Rooms.

WEDNESDAY, MAR. 8—Large consignment of Japan Lilies, Azaleas, and Kentias from Belgium; Begonias and Tuberoses at Protheroe & Morris' Rooms.

THURSDAY, MAR. 9—Hardy Plants, Bulbs, Roses, &c., at Protheroe & Morris' Rooms.

FRIDAY, MAR. 10—Orchids from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°.6.

Railway Rates.

THE very influential deputation from the trades connected with the production and distribution of horticultural produce of all kinds, which waited on the President of the Board of Trade on Wednesday last, may well be satisfied with the result. Not only did the traders prove their case up to the hilt, but in the statistics they brought forward, they showed unmistakeably how extremely important the garden industry is. We use the term garden industry in contrast to the term agriculture. We do not think the general public has any even remotely adequate idea of the extent and value of this gardening industry. Whatever may have been the case once, it is no longer a "negligeable quantity." It has attained its present position rapidly, and as it were, somewhat suddenly. Its growth has been simultaneous with the decadence of agriculture, and no doubt actually consequent upon it. Whilst agriculture has languished, market gardening and fruit-growing in the open and under glass have vastly increased. Small growers have multiplied, and in many cases they have developed into larger growers. Many more labourers have found employment in proportion than a farmer would employ, and the rate of wages is higher. It is evident, then, in the best interests of the country at large, that this now extensive industry should be fostered, and its operations facilitated so far as possible. Leaving on one side the purely luxurious side of the matter, we may say that it is a question of profitable employment of capital—a question of the employment of a larger number of labourers at a higher rate of wages—a question of food-supply for the people—a question of health.

All this will become apparent to the thoughtful reader of the statements made by various members of the deputation, and by the carefully-prepared statistics they brought forward. The President of the Board of Trade (Mr. MUNDELLA) was addressed by Mr. BERRY, of the Canterbury Farmers' Club, Kent; Mr. POUPART, the president of the Market Gardeners' Association; Mr. GEORGE MONRO, of Covent Garden; Mr. GEORGE COLEMAN, representing the interests of growers and salesmen of Potatos, vegetables, &c., for the million; Mr. MYATT, of Hextable, and others.

We refer to our report in another column for the full details, but we may here allude briefly to some of the principal points brought out. The complaints made by the traders referred in the main to the exorbitant, anomalous, and inconsistent rates recently imposed; to the preference shown to foreign competitors, and to the want of security against further rise of rates in future. The subject of classification of goods into certain classes could not altogether be avoided, although Mr. MUNDELLA deprecated the discussion of that subject as one already settled. Still, it came out that Potatos from Kent are charged as grain in spite of their smaller value and less liability to injury.

Mr. POUPART dealt with the question of manure, placing its use by the market gardener at the very low average of 20 tons to the acre, some of the members stating that near London 200 tons per acre were occasionally used! and sometimes as much as 400 tons!! The railway companies did nothing in this case but convey the manure in rough trucks, all cartage and other incidental expenses being borne by the producer. The rise in the price of railway conveyance would, of course, induce the grower to use less; consequently to produce less, and to employ less labour, whilst the sanitary condition of the great towns would be jeopardised by the retention of the manure within their boundaries. Mr. POUPART gave numerous illustrations of the rise in rates for the carriage of salads, green vegetables, turnips, trees and shrubs, pot-plants, &c.

Mr. MONRO alluded specially to the production of fruit, &c., under glass—the amount of which had, as we all know, enormously increased. In this case even, more than in others, it is requisite that the grower should be able to calculate the cost beforehand. If a grower at Broxbourne, who has been sending Cucumbers to Manchester at 21*s.* 8*d.*, suddenly finds the rate put up to 56*s.*, it is certain that he must give up that part of his business; so must he who, paying 11*s.* 8*d.* per ton for carriage of Tomatos from London to Dover, now finds himself mulcted of 28*s.* 2*d.* for the same quantity; so must he who has been sending to Brighton at 14*s.* 9*d.*, but is now charged 33*s.* 9*d.*—the more so as Tomatos are brought from the Canary Islands at £1 per ton! Mr. MONRO gave some figures which show the extent to which Grapes and Tomatos are grown under glass in this country. Thus, excluding what is received from the Channel Islands, his firm alone in the last year dealt with 260 tons of Grapes and 700 tons of Tomatos, all grown under glass! He pointed out that *hundreds of thousands* of labourers were now employed in this industry, and when asked by the President to substantiate his statement, had no difficulty in doing so, his statements being backed by many of those present, who gave interesting details as to the acreage and the amount of wages paid.

Mr. GEORGE COLMAN stated that green vegetables had been raised from 25 to 100 per cent., while small senders are charged such high rates in proportion that their labour is in vain. On the South-Eastern Railway the rate of transport from Higham to London for green vegetables, which was 8*s.* 4*d.*, is now 16*s.* 3*d.*; from Sandwich it was 15*s.*, but is now 16*s.* 8*d.*; from Wrotham (London Chatham & Dover) it was 8*s.* 4*d.*, but is now 16*s.* 3*d.*; and whilst such goods were conveyed from Norwich to London at 10*s.* a ton, the rate now is 16*s.* 8*d.*

Numerous similar statements were made, but perhaps the most galling were those relating to the Continental traffic. Belgian Grape-growers can send to London cheaper than our own growers can do, and whereas it costs 24*s.* 1*d.* to send English Apples from Folkestone to London, foreign fruit sent from Boulogne to London over the same line is charged only at the rate of 15*s.* 8*d.*

Mr. MYATT of Swanley gave some figures showing that, whilst it costs £3 16*s.* a ton to convey fruit from Paris to London, 283 miles, the rate charged from Swanley to London (20 miles) is £1 5*s.*; and from Swanley to Liverpool (220 miles), £5 12*s.* Grapes, Tomatos, and other goods are sent from Swanley to London at 1*s.* 3*d.* per cwt.; whereas, formerly the cost was 1*s.*—an increase of 25 per cent., or to Manchester and Liverpool, an increase of 33 per cent.

Confirmatory evidence of these statements was handed in, and in reply Mr. MUNDELLA, who evidently fully grasped the points, expressed his sympathy with the deputation; and pointed out that the charge made for transport of goods from the Continent, if it could be substantiated, was contrary to the Act of Parliament. As regards the remedy, by means of an appeal to the Railway Commission, he expressed his strong opinion that all such appeals should be made at a moderate cost, and not as now, at a cost which was practically prohibitive. In reference to what had already been done by the Board of Trade, Mr. MUNDELLA remarked that patience and consideration for the railway companies must be manifested, and that under such circumstances he had no doubt the companies would, in their own enlightened self-interest, adopt a more reasonable procedure; in illustration of which, he read letters from the Brighton Railway Company, conceding to the Worthing fruit-growers all they required, and further promising a similar reduction over the whole of their system of railways. As for security for the future, he thought that, guided by their present experience, the railway companies would, in the future, carefully avoid encountering such a storm as they were now involved in.

The deputation retired with a sense of gratification at the way in which they had been received, and at the clear perception manifested by the President of the Board of Trade of their case, and the reasonableness of their complaints.

One other point strikes us in the matter, and that is the fact, that the Royal Horticultural Society took no part in the proceedings, probably because they were not asked to do so. It seems to us very much to be regretted that on such occasions as these, the Society is not in its right place to the fore as the representative horticultural body of the nation. Can it be wondered at, that we have special societies and associations by the dozen, and local societies by the hundred, when the great and most appropriate influence of the Society in such cases as the present is not exerted.

View in the Grounds of Fairlawn, Wimbledon.

View in the Grounds of Fairlawn, Wimbledon.

RAILWAY RATES.—The following letter concerning the pending re-arrangement of railway rates was received by D. ALLESTER, Esq., Secretary of the London Agricultural Seed Trade Association, 6, Market Buildings, Mark Lane, E.C., and is forwarded to us for publication:—"Copy of your letter of the 31st ultimo to the Board of Trade has been laid before a meeting of railway managers, and in reference thereto, I am desired to say that, as the result of the general revision upon which the Companies have been and are still engaged, reduced charges have been adopted for a large number of articles affecting the agricultural and other interests, particulars of which are now obtainable at the stations. Any suggestions which the Companies may receive with regard to specific rates between particular stations will be carefully considered, and it is hoped that when the revision is complete, and all the rates are issued, the result will generally be regarded as satisfactory.—(Signed) WM. BIRT, Chairman of Meeting."

THE ROYAL GARDENERS' ORPHAN FUND.—The monthly meeting of the committee took place at the Horticultural Club, Hotel Windsor, on February 24, WILLIAM MARSHALL, Esq., in the chair. On the motion of Mr. J. WILLS, seconded by Mr. J. LAING, Mr. MARSHALL was unanimously re-elected Chairman of the Executive Committee for the ensuing year. The following special donations were announced:—Sir EDWIN SAUNDERS, a recently-elected Vice-President, £10 10*s.*; a friend at Edinburgh, £2 2*s.*; collecting-box, per Mr. N. KNELLER, Malshanger Gardens, Basingstoke, 9*s.*; and a few other small sums. A letter from the Secretary of State was read, announcing that, by the gracious permission of the QUEEN, the Fund may hereafter be known as the Royal Gardeners' Orphan Fund. The committee unanimously passed a resolution expressing to the Secretary of State the great gratification at the intelligence. A vote of thanks was also passed to Colonel STANLEY A. CLARKE for his co-operation in obtaining the consent of H.R.H. the Princess of WALES to have her name announced as the Patroness of the Fund. The Secretary submitted the result of the recent election of children to the Fund, and announced that the annual dinner was fixed for March 22, when Baron FERDINAND DE ROTHSCHILD, M.P., would take the chair. In the meantime, in spite of the title, it may be as well to say that the benefits of the fund are not confined to the orphans of royal gardeners!

THE BLACKHEATH AND LEWISHAM HORTICULTURAL SOCIETY.—The usual monthly meeting was held on Friday evening, February 24, at the Institute, Old Road, Lee, when Mr. H. J. JONES, F.N.C.S., F.R.H.S., the well-known Chrysanthemum grower, Ryecroft Nurseries, Lewisham, read a paper on "Chrysanthemums and their Culture." The room was crowded by listeners, and the lecture received marked attention; but owing to the very able and practical way with which he treated his subject, very little room was left for discussion. Mr. J. LAING, of Forest Hill, will read a paper on "Begonias" at a meeting to be held on March 21, at the same place.

FLOWERS IN SEASON.—There is an extraordinary brightness and depth of colour about the flower of the Orchids cultivated by Mr. JAS. CYPHER at the Queen's Road Nursery, Cheltenham, which is especially noticeable in the dull season. A box just received well exemplifies this. It contains Dendrobium nobile pendulum, D. n. pulcherrimum, D. n. nobilius, D. n. elegans, D. n. giganteum, D. Phalænopsis Schroderianum, two forms of D. aureum, the one with seven flowers on a spray; D. Cassiope×, D. Dominianum×, D. Ainsworthii×, D. A. Leechianum×, D. Boxalli, D. rhodostoma×, D. speciosum, D. fimbriatum oculatum, Zygopetalum crinitum, Lycaste Younghiana, Epidendrum Wallisii, E. O'Brienianum×, and its two parents, E. evectum and E. radicans, the hybrid very showy, and of a rich reddish-crimson. Oncidium splendidum and some Cypripediums complete the set, and show that the Orchid-houses at Cheltenham must wear a bright appearance, even at this season.

THE WOMEN'S BRANCH OF THE HORTICULTURAL COLLEGE AT SWANLEY.—The first annual report is before us, showing that the women go through the same course of study as the men, except that "they undertake no more of the hard physical work than they feel fit for." The students are trained in all branches of practical horticulture, and instructed in the principles of the sciences on which horticulture is based. An examination was held, with satisfactory results. The two ladies who gained the highest place in the examinations were immediately engaged by a local nurseryman for greenhouse work. The branch is hampered by want of funds, so that we may add that the Hon. Treasurer is Miss EMMELINE SIEVEKING, 17, Manchester Square.

DEATH OF DR. PATERSON'S "OLD MAN."—Dr. PATERSON, Bridge of Allan, is at present lamenting what he describes as the death of his "Old Man," a favourite Cactus plant (Cereus senilis), which has been the wonder and delight of the many visitors to Fernfield during a great many years. Imported from Mexico about sixty years ago, it has been under the care of the doctor for upwards of fifty, and during that long period has grown only about 3 inches. At its death it stood 2 feet high.

WOOLTON GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—Mr. R. G. WATERMAN, Hon. Treasurer of the above, completed on Wednesday, February 22, a course of twelve lectures on horticulture at Eccleston Park, St. Helen's. The lectures, given under the auspices of the Technical Instruction Committee, were of a sound practical character, and among the subjects handled were the following: The culture of market flowers, Tomatos, Apples, Cucumbers, small fruits, vegetables, rotation of crops, preparation of ground, treatment of soils, and the application of manure to different kinds of soils. The average attendance, which numbered forty, consisted chiefly of market growers and gardeners.

A VEGETABLE BALL (CLADOPHORA AEGAGROPILA). — A correspondent sends us, from a Scottish loch, a specimen of this curious Alga, which grows in the form of a ball. The fine green threads, of which it is composed, radiate on all sides from a central core, in this case of mud. It resembles the balls of hair sometimes found in the stomachs of some animals, such as goats (whence we presume the name). The plant grows both in fresh and in brackish water. We have seen specimens from a lake in Shropshire, in which Larch, and other leaves, become entangled in the threads. Generally, the balls are found floating.

LABELS.—Mr. MAX LEICHTLIN writes as follows:—"It is not an easy matter to produce a good plant-label; what we want is a clean label of a light colour, not likely to get smashed by rough treatment, holding the writing well, and of a material that can be written upon with a pencil. The great drawback to the use of zinc is, that the writing must be effected by a special ink, and that it never looks clean. Wooden labels, which may have been cut from wood which four weeks before was part of a tree in full leafage, are very perishable, and, what is worse, are likely to favour the development of fungus in the soil. At the next meeting of the Royal Horticultural Society I shall lay before the members present the best labels I have been able to produce. If they are not perfect, I think they at least come nearer to perfection than any labels hitherto produced. For indoor use, for pot-plants or Orchids, they are unsurpassed."

CASSELL'S POPULAR GARDENING. — A reissue of this work in monthly parts is offered by Messrs. CASSELL. It is a valuable cyclopædia for gardeners, and will be specially useful for those preparing for examination.

WORK FOR THE UNEMPLOYED.—We are requested to publish the following letter:—"In view of the great distress existing in London and the country, will you allow me to state that the Committee of the Self-help Emigration Society are prepared to give financial and other assistance to men able and willing to work on the land, and also to families, to enable them to proceed to Canada in April next. Clergymen and others interested in particular cases should apply to me for forms without delay, as the funds in hand for this purpose are limited. The Society has over fifty representatives in Canada, who provide employment for its emigrants and subsequently look after their interests. The experience of the last nine years proves this work to be one of the best means of permanently relieving distress. EDWARD WILSON GATES, Memorial Hall Buildings, Farringdon Street, E.C., February 28, 1893."

SURVEYORS' INSTITUTE.—The next ordinary general meeting will be held on Monday, March 6, when a paper will be read by Mr. P. E. PILDITCH (Fellow), entitled, "Dilapidation Practice; particularly as affected by some Recent Decisions." The chair to be taken at 8 o'clock.

ROYAL AGRICULTURAL SOCIETY.—Mr. CECIL WARBURTON, M.A., of Christ's College, Cambridge, has been appointed Zoologist to the Society.

THE ROTHAMSTED EXPERIMENTS. — At a meeting of the Royal Agricultural Society on Wednesday last, the Prince of WALES in the chair, it was proposed that some means be taken to commemorate the jubilee of the inauguration of the celebrated field and laboratory experiments pursued on a continuous plan by the zeal and munificence of Sir JOHN LAWES, and his faithful aide-de-camp, Dr. GILBERT. We are precluded by circumstances this week from doing more than mention the matter, but hope to revert to it on another occasion.

NORTHAMPTONSHIRE CHRYSANTHEMUM SOCIETY.—At the annual meeting of this society, the report showed that for last season the total receipts amounted to £140 6*s.* 3*d.*, and the expenditure to £136 16*s.* 9*d.*, leaving a favourable balance of £3 9*s.* 6*d.* The last exhibition was considered very satisfactory, and it was arranged that the show for next season should be held on November 8 and 9 Mr. E. DRAPER received hearty thanks for his services during the past year, and was unanimously re-elected Hon. Secretary and Sub-Treasurer.

EXHIBITIONS OF ENGLISH FRUITS AT CHICAGO.—A well-known fruit-grower says, anent the above:—"English fruit-growers who intend to exhibit at Chicago might possibly be in a better position with regard to their fruit if they would meet and arrange to appoint an agent, who would undertake the care and transport in good condition of the specimens of English fruit to be exhibited."

BURNS AND GARDENING.—The speech of Mr. WILLIAM MILLER at the Warwickshire Burns Club at Coventry, on January 25, and a copy of which is before us, was a very happy, often humorous blending of grave and gay, of pleasing retrospect, and hopeful prospect. BURNS, it appears, was the son of a gardener, and began life as one, and afterwards spoke of the occupation in the following terms:—

> "When rosy morn comes in wi' showers,
> To deck her gay green birken bowers,
> Then busy, busy are his hours,
> The gardener wi' his paidle.
>
> The crystal waters gently fa',
> The merry birds are lovers a';
> The scented breezes round him blaw,
> The gardener wi' his paidle."

That BURNS was an observer of plants we have evidence in a letter to a correspondent to whom he casually made remark that he had some "favourite flowers in spring, among which are the Mountain Daisy, the Harebell, the Foxglove, the Wild Rose, the budding Birch, and the hoary Hawthorne, that I view, and hang over with particular delight." Mr. MILLER found an opportunity, or made one, of recom-

mending the farmers to take up the cultivation of hardy fruits, especially the Apple, and as Mr. MILLER is particularly well equipped for giving an opinion, his advice may be regarded as proportionately important, although he himself goes on to point out the dire disasters that ensued to the First Gardener, and to his descendants, from handling an Apple. The disaster, Mr. MILLER says, was due to the appearance and interference of the middleman!

LAWN TENNIS IN PUBLIC PARKS.—Innovations are not unmixed blessings, and opinions will differ as to the wisdom of the recent decision of the committee of the Royal Botanic Gardens, Regent's Park, to allow the games of lawn tennis and croquet being played there. The intimation in question runs as follows:—"It has been decided to allow the games of lawn tennis and croquet to be played in special parts of the gardens during the summer months, and under certain regulations." The decision, we think, will, on the whole, be regarded as a wise one, so long as the limitations are well defined, and strictly enforced. The spirit of the age is distinctly antagonistic to the reservation of open spaces for the advantage of the few and to the exclusion of the many, and a good deal of friction is often saved by practically recognising this fact.

LES PLANTES DE GRANDE CULTURE.—Messrs. VILMORIN, ANDRIEUX & Co., of the Quai de la Mégisserie, Paris, have just published a descriptive account of the principal agricultural plants, including cereals, forage plants, and those used in various industries, which are cultivated on a large scale. The object is to place before the grower accurate information on the nature and adaptabilities of the several races of cultivated plants with which the agriculturist and market gardener have to deal. Recognising the constant progress and ceaseless change going on in cultivated plants, the authors announce their intention of issuing a new edition occasionally, and request information accordingly from those who are able to give it. A brief description of each variety, an indication of its use, method of culture, proportionate weight of seed, and other particulars are given, accompanied, in many cases, by excellent woodcuts. One very useful chapter is devoted to information concerning the seeds of forest trees, and the proper quantities, per hectare, in which they should be sown. Lastly, there is an excellent index. Issuing from the house of VILMORIN, ANDRIEUX, & Co., this catalogue, which has nothing of the trade circular about it, may be thoroughly depended on.

THE MIDLAND COUNTIES CARNATION SOCIETY.—The schedule of this Society has been arranged, and will be shortly issued, and it will be very similar to that of last year, but with more prizes for those who have not previously won a prize. The exhibition will be held early in August in the Birmingham Botanical Gardens at Edgbaston, and the Botanical Society have also placed two Silver and two Bronze Medals at the disposal of the committee, to be awarded to the most successful exhibitors.

THE NATIONAL PINK SOCIETY: MIDLAND SECTION.—This Society purposes holding the next exhibition on July 11, 12, and 13, in conjunction with the Wolverhampton Horticultural Fête. Ten classes are arranged for Pinks; and the prizes in the class for twelve laced flowers have been increased, and there is a class for six bunches of border varieties. Mr. A. R. BROWN, of Handsworth, also offers liberal prizes for a bloom of his new Pink Amy. Mr. THURSTANS, the well-known Pink grower of Cardiff, has been elected President, and his son, Mr. Mr. C. F. THURSTANS, Pennfields, Wolverhampton, is still the Hon. Sec.

IRISES.—Professor MICHAEL FOSTER contributes to the *Garden* of February 18 a valuable paper on the "Oncocyclus Group of Irises," in which he enumerates the several species of the group, many of which have been described in our columns by Dr. FOSTER and Mr. BAKER. At the conclusion of his paper, Professor FOSTER gives a descriptive list of several hybrids raised by him.

ILLEGAL SALE OF "WEED KILLER."—The occurrence of several cases of poisoning by "weed killer" has, says the *Pharmaceutical Journal*, helped to demonstrate the existence of another source of danger arising from the improper sale of poison. In the prosecution of a seedsman at Barnstaple under the 15th section of the Act, and by authority of the Council, it was argued for the defence that the Pharmacy Act was intended to apply only to medicines, or to poisons "pure and simple," and not to such articles as "weed killer," containing arsenic combined with other ingredients. The judge held that the admission of this argument would destroy the protection against indiscriminate sale of poison which was intended for the benefit of the public, and as it was proved that the "weed killer" had been sold by a person not legally qualified to sell poison, he gave judgment against him. About the same time two other prosecutions under the 17th section of the Act were instituted by the police at Lewes, and convictions were obtained in both cases.

FIG. 38.—ERANTHIS CILICICA: A NEWLY-INTRODUCED WINTER ACONITE.

In Scotland, actions for damages were brought against a railway company and other persons concerned in the transport of arsenical "weed killer," by the leakage of which sugar had been contaminated with arsenic and had poisoned several persons. In these cases judgment was given for the plaintiffs. A similar case of injury caused by a leakage of arsenic shipped without being labelled to show the poisonous nature of its contents, was brought under the notice of the Council, and subsequently a circular was issued by the Board of Trade warning shipowners, shipmasters, and others concerned in the shipment of poisonous articles, that the provisions of the 17th section of the Pharmacy Act must be complied with in such cases.

ERANTHIS CILICICA.

(*Schott and Kotschy, in Œster. Bot. Wochen.*, 1854, *p.* 113; *Boiss, Fl. Orient.*, i., 60.)

A WINTER Aconite, of which roots have lately been distributed by Mr. Whittall, of Smyrna, from the neighbourhood of Adalia, is the Eranthis cilicica of Schott and Kotschy (see fig. 38). It is treated by Boissier as a distinct species, and as the only species which grows within the limits of the region dealt with in his *Flora Orientalis*. He says that it differs from E. hyemalis by its more deeply-incised involucre, with narrower and more numerous lobes (twenty-five to forty instead of twelve to fifteen), anthers ovate instead of oblong, sepals usually broader, and front carpels straight instead of falcate. This is certainly making the most of its difference, for it is easy to find an involucre with twenty lobes in the ordinary winter Aconite, and its fruit-carpels are sometimes quite straight, and never more than slightly curved. I should prefer to regard it as a sub-species only. I have just had it sent as a distinct form from Mr. James Allen, who says that it is just opening its flowers at Shepton Mallet the third week in February, whilst the old species has faded, and that it may also be recognised when growing by its bright red-brown stems. We had it flowering at Kew a year ago. The anthers are shorter than in the ordinary hyemalis, and the sepals are about six in number, and nearly half an inch broad. *J. G. Baker, Herbarium, Kew.*

BOOK NOTICE.

THE ROSE.

A revised edition of the late H. B. Ellwanger's little book under this title has been published by Dodd, Mead, & Co., of New York. Some enthusiastic rosarians no doubt read all the books that come out on their favourite flower. We too as reviewers have to peruse them as they appear. Singularly different are they in the way in which the subject is treated. In some cases it is handled in a severely practical manner, without a trace of imagination, in others jocosely and in a tone of levity, in others learnedly, in some [how few!] freshly; in others wearisomely — how we get to loathe the hackneyed quotations in which some indulge—as worn as the opinions of Bacon on gardening, which so many cite, as if any one in his senses now-a-days cared what Bacon's opinion on such a subject might have been! The author of the present dainty little volume wrote thus in his preface—"This book neither expects nor desires to supersede its predecessors, it asks admission to their fellowship, hoping that it contains enough that is distinctive and of merit to be considered companionable." Thus modestly was the book introduced to the notice of the rosarian. What his opinion was is proved by the revised edition now issued under the supervision of Mr. G. H. Ellwanger, the brother of the deceased author. At Chiswick the judges appointed to assess the merits of plants submitted for trial, mark their sense of merit by the application of one, two, or three crosses, as the case may be. We unhesitatingly append three crosses to this book, confident that the Rose public will fully endorse our judgment.

HOME CORRESPONDENCE.

GOLDFISH.—I read the remarks of Mr. Charles T. Druery and Mr. E. Mills in your issue of Feb. 11 and 18 respectively on goldfish, and as I am interested in them, I should like to add a few words to the subject. In each case I notice your correspondents have their fish in small glass vessels, so that my case varies a little from theirs, as I have mine in a tank in a warm fernery; the size of it is about 3 feet by 3 feet, and 18 inches deep; the rain-

water from the roof all comes through it, which practically changes the water, and the house being a warm one for exotic Ferns, the water is not very cold. When I first put them in about two years ago they were just imported, and three died the first few days, but since that time the remaining nine have done well, and grown to a good size. I notice your correspondents feed their fish on meat, but I have always used ants'-eggs, which are very cheap at a naturalist's, and they have evidently thrived on them. I should like to see them increase a bit; and as they have plenty of room, and the water chilled, I have been expecting they would do so, but have seen no signs yet. I have two nice males among them. I should be glad to hear if any of your readers have had them breed in a similar place, and if so, their experiences with them. *R. C. Williams, Crosswood Park, Aberystwith.*

CAMELLIAS AT TITSEY PARK, SURREY.—In one of the cool vineries at Titsey Park, several Camellias planted out on the back of a centre bed have been trained flat-wise and upwards, but somewhat slantingly to a trellis, so that they present a flattish and almost perfect front of foliage and bloom to the light. The earliest Alba-plena commences blooming very early in the winter—really about October—and a succession of flowers is continued until well into April—really six months of flowers from one house; when later the Vines give considerable shade, the Camellias seem rather to like it, for they make good growth, ripen their wood, and set their buds profusely. The bed is but 3½ feet wide, and the Camellias have been planted nine years. How very superior are they in every sense to pot-plants, and how profusely they bloom! They endure hard cutting every year well, and soon recover. Besides the old Double White, which can hardly be excelled, for at Titsey Park the flowers are very pure and perfect in form, there is the fine striped Countess of Orkney, Beatii, large red; Chandleri, semi-double, but still very beautiful, and others. It is probably rare to find Camellias and Vines thus conjoined. Of course, the Vines are planted outside. During the winter only enough of warmth is given to keep the Camellias comfortably growing, but it does not excite the Vines; indeed, when I saw the latter just recently, they had hardly begun to swell their buds. The glass range here is not extensive, and the most has to be made of it. I do not know any method by which a cool vinery can be more fully utilised all the year round than in the way thus indicated, and it is worked so admirably by the gardener, Mr. J. Dean, who is well known as an excellent one in that district. *A. D.*

POTATO CULTURE.—I have been interested in reading the experiments carried out by your able correspondent, W. H. Divers, with his Potatos, especially as it supports my contention, that land well looked after will pay, but must have more attention than the average farmer affords at the present time, and more labour bestowed upon the working of the same. I had two years ago rather more than half an acre of land well manured with night-soil (we have the earth-system in use), and after being thrown in ridges, the soil was dressed with 3 to 4 cwt. of salt. The crop of Mangels was a splendid one, averaging about 40 tons to the acre. The next season, without adding any more manure, the same plot was planted with Magnum Bonum Potato and Sutton's Early Regent. The Regents were dug in the early part of August, and stored, and to the present time my men have not found any diseased ones. The Magnums turned out a splendid crop, the whole averaging 13 tons to the acre, most of them of a useful size; besides, I have taken a fairly good crop of Savoys and Cabbages, and have a good piece of Thousand-headed Kale coming along, which was planted between the Potatos. We are obliged to make the most of our land, having a number of boys to feed, and many of whom work upon the land and in the garden. *A. J. Brown, School of Handicraft, Chertsey.*

PLANTING EARLY POTATOS.—The month (February) given by "R. D." on p. 174 for this, may be a very suitable one for Devonshire, but it is too early so far north as this place, for were I to plant in February the tops would surely be killed down, and every gardener knows that when that happens when the haulms are a few inches high, the crop will be small, if not worthless. The early varieties are much easier to start into growth in the spring than later ones, and I can best ensure the safety of the early crop by planting early in the month of April, and even then I have to be very careful in moulding them over on the least sign of impending frost. The later kinds do not come through so quickly, and we are able to plant them before the others with safety. I fail to see any protection from frost in the layer of short dung recommended to be placed on the top of the sets. We do not get frost at this period of the year to penetrate 6 inches into the soil; that the manure is useful as a fertiliser, no one will deny, but for my part, I would rather have it applied sooner, and mixed with the soil at digging-time. For the earliest crop, I find the old Walnut Leaf Kidney is still one of the best, as it produces more large tubers in proportion to the small ones than the ordinary Ashtop varieties do. Sharpe's Victor is of no use here as a first early on account of its poor quality, but for weight of crop it is not easily beaten at the beginning of the season, and I believe it is fit for use early on some soils. *W. H. Divers, Ketton Hall Gardens, Stamford.*

THE ROYAL HORTICULTURAL EXAMINATIONS.—I find with others who come into contact with gardeners and amateurs, especially in lecture classes, that very much interest attaches to both the proposed national examination in horticulture in May next, and the proposed scholarships competition. Some young men who have already sat for similar examinations fully understand them. Others regard them with much doubt, because they do not

FIG. 39.—APPLE ARMOREL: NEW VARIETY OF APPLE. (SEE P. 268.)

understand exactly how conducted, or the nature of the tests they will impose upon the candidates. I would venture to suggest that it would prove exceedingly helpful to these latter, and they are the larger number, could a paper of questions be formulated at once, based on the published syllabus, but yet entirely diverse from, yet neither easier or more difficult than the questions that will eventually be formulated for the actual examination. Having such questions, and the opportunity thus offered to understand their purport, and to practise answering them to the best of any intended candidate's ability, would be so useful, that very many more might in that way be induced to become candidates, whilst it might lead to the weeding out of many who find themselves to be utterly incapable of mastering the questions. Whilst it is urged that County Councils do not in all cases allow their lecture courses on horticulture to cover so wide a ground as the Royal Horticultural Society's syllabus does, yet in such cases intending candidates might do very much if young gardeners, to fit themselves for the examination by obtaining such books as bear upon the particular parts of the syllabus of which they know least. In some instances, a few youths or members of a class or association could unite and purchase two or three books, and each use them as needed. In other cases it is possible that head gardeners could help their young men from their own book-shelves, at least it should be the aim and the pride of every head gardener, not only to induce some of his juniors to sit for the examination, but to render them in the matter of opportunity and sound advice every possible assistance. In the examination held in the county of Surrey last year, growing out of the technical education horticultural course of lectures, school teachers gained the highest number of marks. That probably arose in a large degree, first from their great acquaintance with the routine of examinations, and capacity to take liberal notes; and second, because they have in most cases had class help in the subjects of natural or plant physiology, chemistry, geology, &c. On the other hand, if young gardeners would, with all the practical knowledge they have acquired, aided by the theoretical information they can gain from text-books, but enter the examination, they should be able to distance school teachers, who are not gardeners, easily. To that end, I think the setting of a series of trial questions, on the lines of the actual test questions that will be formulated for the examination, and distributing them at once, would be immensely helpful, and greatly serve to encourage the modest or timid to enter as candidates for the real examination in May next. *A. D.* [As soon as we can find room, we will reprint last year's questions, which will indicate the general character of the future examinations, probably. Ed.]

THE ORPHAN FUND.—Personally, I wish canvassing could be entirely abolished. I know cases where it has been a difficult matter to find the money for the purpose; but I would earnestly appeal to all my brother gardeners to give this Fund an increased amount of support, both by their presence at the annual meetings, and by their subscriptions. They need not trouble to send very far to pay their subscriptions, for there are local secretaries in each district, and I for one would not object (if some of them, who are not in receipt of very good wages, and have little or no show-money to take) to accept the smallest sum per month, and at the end of the year to forward it to head quarters. The hope of our country is centred in the children; and surely all sections of gardeners should support the little ones, for whom we find it difficult to make provision, knowing not the hour or day when we may be called hence. *A. J. Brown, Local Secretary for Chertsey.*

THE PROPOSED CITY FRUIT SHOW.—In one respect it is unfortunate that this proposed great fruit show has fallen through for this year, because there is ample reason to hope that we shall have a fine fruit season. On the other hand, it is well, perhaps, that the promoters are saved from the mad plan of erecting, at enormous cost, a special building for the show on the Thames Embankment; but the absence of this show should be the opportunity of the Council of the Royal Horticultural Society. What a pity it is, that for the sake of seizing so splendid a chance to make a grand hardy fruit display, the proposed Agricultural Hall Show cannot be held at the end of September rather than in August. House-grown fruit we can have at any time, let the season be what it may, but we cannot have a grand show of hardy fruit every year. The August show will clash with scores of provincial shows; one a month later it would clash with none, and I think, so far as fruit is concerned, and especially hardy fruit, that by far the larger number of growers would favour the later date. In making this suggestion, I am actuated by a desire to see the Royal Horticultural Society step in when it has the opportunity, and do for hardy fruit in London what no exhibition, however good, has yet accomplished. This is not a private suggestion for the Council; it is rather one for everybody interested, and it would be most useful could general opinion be gauged in the matter. *A. D.*

AMERICAN AND BRITISH APPLES, AND THE NEW RAILWAY RATES.—In reply to your question, How about New Railway Rates? inserted by you under the above heading in last week's issue, I beg to say those applicable to the points referred to in my letter are very little affected by the attempted rise. The increased new rates adopted may well be considered really a very sharp trick to outwit the public. By the Act the rates (maximum) were reduced. The companies, with few exceptions, charged up to the maximum, consequently being much in excess of old rates previously in force, naturally alarmed the public, who were expecting the much-needed lower rates, and now in their despair they cry for the renewal of old ones. Of course, it is part of the railway companies' tactics to make believe they will consider and reconsider the repeated request to adopt the old rates, that seemingly is being gradually done piecemeal under special pressure from the Board of Trade. The greater the difficulty in obtaining it the greater the satisfaction when obtained. If the

companies were honest, they would do at once what I believe they have decided to do; but they know that, by giving way without a good show of opposition, the door would be the more quickly opened for demands for rates more in accord with those that were promised by Act, which really are necessary and badly needed, specially by the market gardening interest. *J. B. Thomas.*

AMERICAN AND ENGLISH APPLES. — I was pleased to read Mr. Thomas' recent note on this subject. The price he quotes was realised up to December 3; then came a sudden fall in price on the arrival of the American fruit, and this for the finest fruit grown here this season. Blenheim Pippin and Cox's Orange Pippin were sent by me on December 9 to Covent Garden, so that they might hold their own against the imported ones, but these fruits only realised the price that I mentioned in my note. I do not question Mr. Thomas' statement as to the prices which came under his notice; nor do I question my salesman's returns, his long-standing and large connection placing him above suspicion. I am glad to hear that some growers got more for their fruit than I did; while others did not pay so much for their barrels of Apples; still, 40*s.* was the sum paid for two barrels of Apples of the first arrival. Mr. Thomas says, "It is nonsense to say the public hankers after what is grown abroad, but demand what they well know to be good, which has not been obtainable from English growers." How is it then, that, as he states, English fruit can be seen in many shops in Covent Garden Market displayed in American packages? Why, simply, it is to sell them at better prices. But until the consumers, housewife, and cook, and all awaken to the fact that one pound of home-grown Apples contains thrice the quantity of nature-distilled water, malic acid, and sugar, and is worth three pounds of the dry woody fruits sent to this country, the thing will go on [!]. He says, "I must know that it takes more than a few years to get up an orchard of Blenheim Orange and Cox's Orange." Yes, I do know that, for I have been well acquainted with these varieties for thirty years in the west-midland counties, sunny Kent, and sandy Surrey; but it only takes a few years to bring old trees, if healthy, into excellent bearing, and these trees bring the largest and by far the highest-coloured fruits. It is time and money wasted to destroy old treesof good varieties, if healthy. If people had been taken with Mr. Thomas' theory, and led to put it into practice, the present great advances in fruit culture would not be observed, and we might have to wait a very long time for them. All gardeners know that a neglected tree fifteen years old, if properly renovated, and the fruits thinned, will produce the best fruit, and is capable of so doing for fifty years afterwards, for it is not always age but bad treatment which is answerable for inferior fruit. We are twitted for not being alive to the requirements of the day, and as lacking in courage to put capital into the land. What sane man would put much of his capital in land held under unsecured tenancies? And, again, what would be the result if landowner and capitalist had done so in times past, and the home-grown fruit had competed with the enormous importations of the present day? why, the result would have been disastrous to all concerned. Mr. Thomas says there is nothing to fear from Tasmanian or Australian imports, owing to the great cost of transit, which amounts to 8*s.* or more per case to put on our markets. That is a wide margin from the freight bill I have lying before me, which is, Tasmania to London, usual cases, 4*s.* 6*d.*; Tilbury Docks to Depôt, 3*d.*; carting, toll, &c., 3½*d.*; total, 5*s.* 0½*d.* There is nothing to fear from any imported fruit if the produce of our orchards was bought on its merits. There is some encouragement held out to us by Mr. Thomas when he says that American orchards have passed their best time. I have a letter before me, just arrived, which predicts the rapid decay of American orchards. The Apple tree, it seems, cannot stand a short-growing season and excessive heat, hence the trees are becoming devitalised. But it is not so with ours; here the trees are, as it were, at home, and there are no Apples from any other country comparable to the juicy produce of Britain. There is one startling fact that has been brought out with regard to the imports of French fruit. The statistics of imports from that country to England furnish us with the most emphatic reply that could be given, and show that in 1884 the import of French fruit was valued at 21,824,616 fr.; in 1889 it had fallen to 12,725,861 fr., so that French imports to England were reduced by quite 6,000,000 fr. Let us hope that we may check the imports from America at the same rate; but there must be the cultivation of a taste for home-grown fruit, and persistent and unceasing endeavours made on the part of growers before this desirable change is brought about. I may note, that since the quantity of American fruits has dropped off, prices have gone up considerably. *A. Evans, Haslemere.*

HARDINESS OF EUCALYPTUS GLOBULUS.—This tree flourishes at Falmouth in rather exposed positions; at Penmere, 1 mile distant, there are several trees from 50 to 70 feet high, which flower and seed every year very abundantly. One of these trees has a circumference of 8 feet at a height of 2 feet from the ground; and 7½ feet at 6 feet from the ground. In my garden, which is sheltered, they grow too fast for their roots, and a strong gale blows them down. *Howard Fox, Rosehill, Falmouth.*

APPLE ARMOREL.

We are now enabled to give an illustration of this Apple (fig. 39, p. 267) from a specimen obligingly put at our disposition by Messrs. Cheal. It was raised, we believe, by Mr. Ross, of Welford Park Gardens, and its merits have been recognised by the award of a first-class certificate by the Fruit Committee of the Royal Horticultural Society. Good Apples are so common, and the number of Apples generally so great, that it is only those which have specially good qualities that are likely to obtain such an award. The Apple in question is "small," that is to say, it would belong to numbers 1 and 2 of the scale of magnitude of Apples that we adopted from the report of an American Pomological Society (see *Gardeners' Chronicle*, November 5, 1892, p. 568). It is globose in shape, depressed at base and at the top, with a short stalk and a closed eye. The skin is yellow, thickly covered with russet. The flavour is said to be excellent, and its keeping properties may be judged by the fact that it was shown in good condition by Messrs. Cheal at a recent meeting of the Royal Horticultural Society. Messrs. Cheal speak of it as a good cropper.

FAIRLAWN, WIMBLEDON COMMON.

[*See Supplementary Illustration.*]

Fairlawn House, Wimbledon, the residence of Sir Edwin Saunders, the President of the National Chrysanthemum Society, is most pleasantly situated on the east side of Wimbledon Common, having command of a somewhat extensive view, reaching to Roehampton on the right, the great common and Coombe Woods in the centre, and on the left the rapidly-growing suburb of New Wimbledon. In the rear of the mansion and grounds are woods and pleasant country roads, and it seems difficult to conceive of a suburban residence more admirably and conveniently situated than Fairlawn. On taking possession of the place—which is something like six acres in extent—some years ago, Sir Edwin Saunders had the advantage of the counsel of the late Mr. Robert Marnock, and the visitor can see evidence of the skill of this distinguished landscape gardener. Since the grounds were originally laid out, various alterations have been made with considerable advantage, but without in any way detracting from the appropriateness or merits of Mr. Marnock's plans.

The pleasure grounds are by no means extensive, comprising, in fact, only a few acres, but the most has been made of the space at command. The mansion stands back a little distance from the main road, allowing of a semi-circular carriage-drive; and between this road is a stretch of turf plentifully planted with evergreens and picturesque trees, with belts of evergreen and deciduous shrubs at both sides of the drive. The shrubs are kept cut in so as not to obstruct the view across the common, and on the outskirts of the common, by the main road, the trees are judiciously thinned, so that delightful vistas are opened up in various directions. On the south side is a spacious ornamental conservatory, gay with flowering plants at all seasons of the year, and especially in autumn, when the large collection of Chrysanthemums is in bloom. On the walls are various flowering plants, giving a succession nearly all the year round.

In the rear of the mansion is a broad stretch of the softest velvety turf, falling away along a gentle declivity to some distance. The admirable condition of the lawn does great credit to Mr. A. Newell, Sir Edwin's gardener, who takes great pride in it, and gives it the best of attention.

The illustrations of the grounds which accompany this article give, better than in the form of descriptive notes, some idea of the beauty of the grounds in summer. There is a judicious mixture of imposing trees, with belts, groups and specimens of evergreen and decidious shrubs, Rhododendrons being a leading feature; and what particularly strikes the visitor is the wealth of evergreens, which gives the place a well-furnished appearance in winter. Handsome specimens of Coniferous trees are to be met with here and there; but as the grounds are limited in extent, and the growth of some is rapid, annual prunings are necessary, but as this is done judiciously and with excellent skill, it is not noticed; nowhere does the overcrowding or overgrowth of tree and shrub meet the eye.

From the terrace at the back of the mansion, the visitor looks down upon a pleasant Rose garden; and away at the sides and in the distance are seen handsome trees of various shapes, and representing many tints of the living green shown by robust vegetable life. The extremity of one view shows a rustic bridge crossing a small piece of ornamental water, at another point is seen an arbour; anon a group of statuary, but nothing obtrusive. Every detail appears to be united in a general expression of harmonious fitness; and the admirable manner in which the grounds are kept lends value to their exquisite beauty.

Away to the right, but in the rear, is a small and well-planned fruit garden; the soil a rich dark loam, in which pyramid Apple, Pear, and Plum trees make clean growth, and produce good crops. Against the walls are Peach and Nectarine trees, and excellent crops of vegetables are produced. The glass structures are limited in number, owing to the restrictions of space; vineries, a Peach-house, plant-houses, and capital frames are seen, all in the best order. Of his Peach-house, Mr. Newell is honestly proud. In it is seen a fine tree of Dr. Hogg Peach, the annual crop from which during the past twelve years has averaged something like 200 finely-developed fruits.

In the plant-houses are collections of useful decorative subjects, including some good specimens which find a place at the Wimbledon flower shows. Tuberous-rooted Begonias are admirably grown by Mr. Newell, and he is a formidable competitor with them. Towards the end of the summer he has a collection of fruited Capsicums, which are most valuable for decorative purposes in the autumn season of the year.

The liberality with which Sir Edwin Saunders maintains his garden, and encourages his gardener, is extended to horticultural institutions. As President of the National Chrysanthemum Society, he has proved a most generous supporter of it; an influential Fellow of the Royal Botanic Society; he is also in close touch with other bodies of a kindred character, and has recently been elected a Vice-President of the Gardeners' Orphan Fund.

PUBLIC PARK, RAMSGATE.

It having been decided by the urban authorities that the town stood in need of a public park, landscape gardeners were invited to furnish plans for the same, and that devised by Messrs. J. Cheal & Sons, Crawley, was the one accepted.

We take the following from the explanatory note which accompanied the plan kindly sent to us by Messrs. Cheal.

The ground being already of a picturesque and ornamental nature, the plan generally embraces the adapting of the park to the public requirements.

In the first place, it is considered a necessity to provide a carriage drive through the park for the use of invalids, elderly people, and others; and the course for this drive, as shown, would enable a visitor to enjoy most of the beauties of the place without alighting. The course is commenced at the main entrance in the High Street, and follows easy curves to the central avenue in front of the terrace, with the fountain on the other side, and then it turns past the tennis-lawns towards the higher ground on the opposite side, ascends a shady valley, and follows the line of the old Elm trees on the high ground, from which and especially when emerging from among the Elm trees to the north, good views are obtained over the entire park. The exit is made by way of Ellington Road, another main thoroughfare of the town.

The next important point to consider is some central position for a promenade or assembly ground. The space selected for the terrace appeared to us to afford everything required to make it perfect in that respect, it being backed up by high trees and shrubs to the north, with a few large shady trees in the front, and the ground when raised to a higher level, with its wall and balustrade in front, would afford an elevated platform, from which views of the whole of the park could be obtained, a point of no mean value. In the laying-out of the ground, it has been a point well studied to spread as many objects of interest as possible in the view from this central point, and openings are arranged so that views can be obtained in places of the full extent of the park, at the same time concealing as much as possible the actual boundary. Flights of steps lead from this position to the central avenue and fountain, and also from the ends of the terrace to the various walks and drives in the other parts of the ground. Walks lead from one entrance through the park in fairly direct lines to others, for the convenience of those who may have to cross the grounds.

The tennis-lawns are placed where the ground is level and sufficiently low, so as to be easily flooded in the winter as a skating area.

As no landscape is complete without water, a lake has been introduced, and though small, it will doubtless, have a pretty effect with the background of trees, and the ornamental bridge spanning it in the foreground.

A few flower-beds only have been designed, just sufficient to give a little bright colour to the central avenue and the more dressed portion of the ground. The natural beauties are principally relied upon to give effect and variety to the scene. The fine trees already upon the ground will afford grateful shade, and the introduction of the fresh varieties of trees and shrubs will give additional colour and variety of foliage and flower. There will also be great natural beauty in the slopes and undulations, which will be improved at various points, as for instance by the taking up of the present tennis-lawn in the valley and restoring the ground to its natural dip instead of leaving it at its present artificial level and straight lines.

Fig. 40.—Plan for laying-out public park, Ramsgate. (see p. 268.)

Obituary.

The Late Mr. G. W. Phippen.—A notice of the death of this promising young horticulturist appeared in the *Gardeners' Chronicle* of last week. Born at what was then known as the Oxford Road Nurseries, Reading, in 1864, he succeeded, at the age of twenty-one, on the death of his father, to the nursery and seed business established some years previously. Possessing much energy and business qualifications, he rapidly extended its operations, and on the site of the new Victoria Nursery Grounds had erected a number of glasshouses, cultivating a variety of plants, and carrying on a good seed and decorator's business in Broad Street. Under the Reading Corporation he maintained the public gardens in the Forbury in a high state of perfection; he had at one time the management of the horticultural department in the Reading Cemetery; he acted as Superintendent of the Exhibitions of the Reading Horticultural Society, and he also laid out the new public park at Reading, the gift of the late Mr. W. J. Palmer. For two or three years past he had held at the Town Hall an exhibition of spring-flowering plants. As a floral decorator he showed much originality, and gained a wide reputation. He was a Fellow of the Royal Horticultural Society, and also a member of the Floral Committee, a member of the National Chrysanthemum Society, and during 1892 was one of the foremost exhibitors at the Earl's Court exhibitions. He took an active part in a good deal of religious and philanthropic work at Reading, and his funeral on the 27th ult. was of the character of a public demonstration. Mr. Phippen was twenty-nine years of age, and the cause of his death was blood-poisoning. He leaves a widow and three children to mourn his loss.

M. Antoine Chantin.—We greatly regret to hear of the death of one of the patriarchs of French horticulture, who died in his seventy-eighth year, at his residence, Avenue de Chatillon, Paris, on the 26th ult. M. Chantin will be much missed at exhibitions, where his venerable appearance caused him to be called, playfully, Pilocereus senilis. M. Chantin was deservedly much esteemed by his colleagues.

GARDENERS AND THE RAILWAY RATES.

Deputation to the Board of Trade.

High Rates—Inconsistent Charges—Preference to the Foreigner—Want of Security.

Speeches of Messrs Berry, Poupart, Monro, Coleman, and Others.

Satisfactory Reply of Mr. Mundella.

A deputation from the London Fruit, Flower, and Vegetable Buyers' Protection Association and kindred bodies, waited upon Mr. Mundella, M.P., Pre-

sident of the Board of Trade, on Wednesday, March 1, for the purpose of complaining of the high railway rates charged under the revised scale. The Hon. Wm. F. D. Smith, M.P., introduced the deputation, which included Mr. J. Webber (salesman), Mr. W. W. Berry (representing the Kent fruit trade and the Canterbury Farmers' Club), Mr. Geo. Monro (salesman), Mr. C. Liddiard (commission buyer), Mr. W. Poupart (president of the Market Gardeners' Association), Mr. Geo. Coleman (vegetable salesman), Mr. G. C. Bond (secretary of the London Fruit, Flower and Vegetable Buyers' Protection Association), &c. Mr. Mundella was accompanied by Mr. T. Burt, M.P. (Parliamentary Secretary of the Board of Trade), Sir Courtnay Boyle (Railway Department, Board of Trade), and other officials.

Mr. Smith, M.P., in introducing the deputation, said it represented the London Fruit, Flower and Vegetable Buyers' Protection Association, and the market gardeners, nurserymen, and fruit growers from the whole of the country, but particularly the home counties. It comprised representatives of distributors, buyers and producers. It might be imagined from the title of the Association that its work was confined to London alone, but that was not so. Covent Garden Market was the Clearing House for an enormous amount of produce which came to this country from all parts of Europe, and the great increase that had taken place in the railway rates charged by the various railway companies most prejudicially affected the interests of those concerned in the trade. The home producer already suffered sufficiently from our climate, and his position had been aggravated by the new rates. He did not wish to take up more time than was necessary, as there were others present more competent to speak on the matter under consideration, but he would like to mention one case. That was that the rate for Cucumbers from Broxbourne to Manchester which was originally 21*s.* 8*d.* per ton. The rate was now 56*s.* per ton.

Mr. Mundella: On what line would that be?

A Member of the Deputation: The Great Eastern, the Great Northern, and the M. S. & L.

Mr. Smith went on to say that from Malvern Wells to Manchester, the rates for hot-house fruit had increased from 2*s.* 6*d.* to 4*s.* 2*d.* per cwt. The hothouse industry was a very important one, because he found that where a few years ago only 10 lb. of that class of produce was sent by rail, there was now a ton. Tomatos were also a very important class of produce, and in this case the rate had been increased between London and Dover from 11*s.* 8*d.* to 28*s.* 2*d.* He mentioned these few rates as they had struck him as being particularly curious. As he had said, the home producer had sufficient to contend against, but if to all the natural disadvantages were to be added prohibitive railway rates, he feared that the market gardeners and the farmers of this country would find it impossible to carry on their trade at all.

Mr. W. W. Berry said it was not his intention to go deeply into the question, because he knew full well that the whole matter was thoroughly gone into by Sir Courtnay Boyle and Lord Balfour of Burleigh, and the points were pretty well understood by the Board of Trade. But he was anxious to allude to one or two matters which were of great importance, not only to those represented there that day, but to all connected with the industry throughout the country. With regard to the question of classification, they understood that it was the intention of the Board of Trade that something like a uniform charge should be made for all articles that were put into a certain class. If that were not the case, where was the advantage of having articles classified? The southern lines were charging their full maximum rates. Then they were, as an industry, in a very awkward position. Take class C. as an illustration. This class contained grain and the products of grain, and it also contained Potatos in sacks, but it would be seen that Potatos were only about half the value of grain per ton. Various articles had been reduced, and the companies said they were reducing the charges, but they were only reducing certain items in a class, and leaving the others high and dry, to be charged at the full maximum rates of the company.

Mr. Mundella.—What line are you referring to?

Mr. Berry said he was referring to the Chatham and Dover Line. The companies acting in the way he had mentioned necessarily left a large number of small traders, who occupied a small acreage, out in the cold, because, owing to the fact of their being small traders, they could not take advantage of the more advantageous terms offered for larger quantities.

Mr. Mundella: From what I gather from these tables you have sent me, the company is now charging 17*s.* 11*d.* for what they formerly carried for 9*s.* 7*d.*

Mr. Berry: Yes. The question of classification which was dealt with by the Board of Trade, was one which affected the traders deeply.

Mr. Mundella: Before you allude to the question of classification, am I to understand that you are perfectly satisfied with the action of the Board of Trade so far as the classification and the maxima are concerned?

Mr. Berry: Not as to the maxima; but, as to the classification, yes. They had had a most efficient and careful hearing from the Board of Trade, and they thought the Board had done its best to do what was right. If the class rate had been reasonable he took it that they would not have been there that day. The endeavours of the Board had been frustrated in many instances, by leaving those represented by the deputation high and dry, and reducing other articles in the same class. If they threatened to go before the Board of Trade the railway companies would answer that they were within their maximum powers. If within the next six or nine months the companies came down to the level of the rates which existed before 1888, they contended that they would not then be in the position they ought to be, because many anomalies would still exist, and there would be nothing like like security, unless a tribunal were established with power to carry out its decisions, and to compel the companies to abide by them. The costs of an inquiry before the Railway Commissioners made such a procedure entirely out of the question for the fruit-growers and market-gardeners of the country. It was said in the press that the companies were making reductions right and left, and that they were promising full consideration to all matters placed before them. He feared that the companies were throwing dust in the eyes of those who were endeavouring to do what was right for the trade.

Mr. Poupart said his association numbered rather more than one hundred members. Dealing first with the question of production, he went on to speak of the importance of having reasonable rates for manure.

Manure.

Mr. Mundella asked how many tons of manure were used to the acre?

Mr. Poupart said about 30 tons, more being required the nearer the place was to London. The old rates from Battersea to Wallingford (?) were 1*s.* 10*d.*; they were now 2*s.* 3*d.*, and that on only 20 tons to the acre would be a matter of 8*s.* per acre additional tax.

Mr. Mundella: Are chemical fertilisers charged more?

Mr. Poupart said the rate for these had increased from 5*s.* to 6*s.* They contended that the old rates were too high, seeing that any ordinary strong truck was good enough to carry manure, and bearing in mind the fact that it was never touched by the company, who provided no sheds or any other protection.

Mr. Mundella: Do you cart and load it?

Mr. Poupart: Yes; and unload it. The company never touch it. No cloths are required, and there is not the slightest risk. They contended that the greater the assistance rendered by the companies to the traders in the matter of manure, the more would the companies get back in the way of produce. Then, again, it would be a disadvantage to the public if this manure was not carried away from London, what would be the position of London if the manure were not moved even for one week? It would be within the recollection of many, that before the abolition of turnpikes, manure was allowed to be carried toll free all through the country.

Seeds.

On the question of production he might allude to seeds. The rates for seeds had risen as much as from 5 per cent. to 25 per cent., and in some cases even cent. per cent. Having spoken of the increase of rates between London and three towns in Bedfordshire, viz., Blunham, Sandy, and Potton, he admitted, in reply to Mr. Mundella, that the lower rate charged for the longer distance in one of these instances was due to competition.

Salads.

A gentleman at Isleworth, who cultivated salad, had complained that the old rates to Leeds and Birmingham, which were an average of 1*s.* 2*d.* per case, had now been increased to 2*s.* 2*d.*, a little rebate being allowed for cartage. This meant an additional expenditure on the part of the cultivator of £8 15*s.* per week for 200 cases, a very serious matter.

Green Vegetables.

The old rate for green vegetables was 8*s.* 4*d.*, it was now 17*s.* 2*d.* for one ton, or 14*s.* 2*d.* for more than a ton. The old rate for Turnips from Ramsgate to London was 10*s.* 10*d.*, it was now 24*s.* 2*d.* The effect of all this was extremely disastrous, and the low price of produce would not bear further taxing. It would also in the end prove detrimental to the cheap food supply of the people. They wanted to know why there had been this increase of rates. Trade was not so flourishing. They were a branch of agriculture which was entirely overlooked. The poor farmer did not stand alone in respect to bad times, the market gardeners, nurserymen, and others, feel the pinch quite as badly as the farmer. They wanted to know if the present was the time to add to the burdens of their trade. He had not noticed that the dividends of the railway companies had gone down very much. The railway carriage had increased largely during the last ten or fifteen years.

Mr. Mundella: You mean that there has been a large development of your industry?

Mr. Poupart: Yes.

Mr. Mundella: Has there been an increase of land brought under cultivation?

Mr. Poupart: Undoubtedly, a very large increase.

Mr. Mundella: And it is capable of much further extension?

Mr. Poupart: Certainly. The increase has gone on in Lincolnshire and Essex in my recollection, and it will still increase as London gets bigger. Mr. Poupart, continuing, said, it was true that some of the companies had reduced their rates; but they contended that the old ones were too high, and he would like to ask, how did they know the rates now lowered would not be put back again?

Mr. Mundella: You mean, what security you will have?

Mr. Poupart: Yes. They wanted protection for the future, as any sudden rise would put out all their calculations. So far as he could see they had no guarantee. Up to the present the traders had not had much to complain of, but they would feel the pressure when the Strawberries and other fruits came in.

Fruits under Glass, etc.

Mr. George Monro said: I am here on behalf of the fruit growers, and particularly representing the growers of fruit and flowers under glass, and would like to point out a few of the instances where rates have been increased beyond all reason, which increase if maintained will seriously cripple our trade, and in many cases stop business altogether. The first case I will take is that of a grower near Broxbourne who has gone largely into Cucumber, Tomato, and Grape growing, not only for the London market, but also for Manchester; up to this year he has been paying for Cucumbers packed in hampers, 21*s.* 8*d.* per ton, and for Tomatos, also packed in baskets with lids, 35*s.* per ton; but on enquiring what the charge will be this year, he was told the rate is now 56*s.* for both. But they do not know if they will charge quite so much as that. This is very unsatisfactory, as he does not know whether to plant for Manchester or not, as he will not be able to send any if at 56*s.* This grower is one of forty or fifty in the north of London, all affected in the same way. They have gone largely into glass culture, thinking that if London was over-supplied they were near the rail and could fall back on the northern markets. The next case is that of a grower in Wales, who has established a considerable lot of glass to supply fruit and cut flowers to London, Manchester, and Liverpool. He now writes, saying the rate to Liverpool has risen from 2*s.* 6*d.* per cwt. to 4*s.* 11½*d.* passenger, to Manchester 2*s.* 6*d.* to 4*s.* 2*d.*; London, 3*s.* 6*d.* to 3*s.* 7*d.*; and he says this will compel him to sell his produce in the nearest towns, such as Worcester and Cheltenham, and as these are oversupplied now, he will be a great sufferer. The next case I will mention is that of the orchard fruit growers in Buckinghamshire. In a letter from Lord Rosebery's agent, he gives the rates to Manchester and London—all increased; and says that in a full fruit season, the increase will be a great tax on the growers, and in this neighbourhood are a large number of small thrifty farmers who look to their orchards for a great part of their income. A great many other small growers complain of the ½ cwt.

minimum being replaced by the 1 cwt. minimum, as there are many kinds of produce which must be sent daily as ready. This affects all growers at times, but particularly those commencing business, and small growers generally. We wish you particularly to understand that we plead specially for the small growers, who suffer more than large ones; knowing, as we do, that our trade is composed of a large number of small growers, or of those who have risen from very small beginnings. As to the charges on empties, at one time most lines took returned empties free, and this is not so unreasonable as it appears at first sight; for instance, Grapes, if sent by rail, have to be packed in strong packages to protect them, and 12 to 14 lb. of Grapes are often packed in baskets weighing 8 to 10 lb. each, and carriage is charged on gross weight, so that the railway companies having got carriage on baskets at class 5 rate, should convey them when empty, free. This applies to flowers and all hothouse produce. I will only take up your time with one more case, where the increase comes directly on the grower, and that is from a large grower of plants and cut flowers, and who has orders from all parts: he gives me the following increases, passenger:—London to Liverpool, from 4*s.* 5*d.* to 11*s.* 8*d.* per cwt; London, to Dublin, 7*s.* to 11*s.* 8*d.* per cwt.; London to Manchester, 4*s.* 5*d.* to 9*s.* 4*d.* per cwt.; London to Glasgow, 6*s.* 3*d.* to 11*s.* 8*d.* per cwt.; London to Birmingham, 3*s.* 4*d.* to 7*s.* per cwt.; these are all at company's risk. The same grower uses a large quantity of cocoa-fibre refuse, the carriage of which from Millwall Docks to Broxbourne has risen from 2*s.* 11*d.* to 5*s.* per ton; thus showing that they feel the increase on what they use, as well as on what they grow; and there are many instances of this.

Foreign Fruit, Etc.

Another grievance is that foreign fruit is brought at a much cheaper rate than English, for instance, all goods from Boulogne via Folkestone cost less money than from Folkestone. Apples, Boulogne to London, 15*s.* 8*d.*, Folkestone to London, 24*s.* 1*d.*; New Potatos, Boulogne to London, 22*s.* 8*d.*; Folkestone to London, 24*s.* 1*d.*; Pears, Boulogne to London, 15*s.* 8*d.*; Folkestone to London, 24*s.* 1*d.*; Onions, Boulogne to London, 15*s.*; Folkestone to London, 20*s.* 2*d.* But there is another chance the railways have, and that is, when our goods are sold to go to different towns, which, of course, comes indirectly on the grower, as whatever tax is put on the goods must come off the net price. If we sell Tomatos to go to Dover the carriage is risen from 11*s.* 8*d.* to 28*s.* 2*d.* per ton, goods train; to Brighton, 14*s.* 9*d.* to 27*s.* 1*d.*; to Portsmouth, 21*s.* 8*d.* to 34*s.* 8*d.*, and although the growers can send Grapes from Worthing at company's risk at 53*s.* 4*d.* per ton, if a Brighton customer buys any in London he is told the rate is 1*s.* 6*d.* per box averaging 12*s.*, which comes out at over £13 per ton. This, of course, is evidently done with the intent of killing the trade at one blow, and was put on last year before the general rise. If he sends at his own risk they are liable to be damaged, or he leaves them alone altogether. Worthing growers were reduced as they formed an important body, and laid before the company proof that they could send cheaper by road, but individual growers could not get this. Having given these instances of increase, I would like to say a word or two on company's risk. We were quite satisfied with the ordinary or owner's risk rate before, which enabled us to claim if damaged through carelessness or neglect of their servants, and that is all the risk there is. We do not wish to pay 25 to 50 per cent. more carriage to ensure against collisions or accidents, but only to get careful handling of goods, well and securely packed; and as the railway companies cannot make their servants take ordinary care, we are compelled to pay these excessive charges. It is shameful the way fruit is treated by them, and it seems to me that the increase was only put on with a view of getting the owner's risk note altered, which puts it entirely out of the question, as no grower can sign himself away in that manner. I never knew any damage from other cause than from careless handling. I should now like to draw your attention to the position our trade holds as employment of labour, and do not hesitate to say that there are hundreds of thousands of hands employed; for not only are there large numbers in the market gardens all over the country, but there are thousands employed in the retail shops in distributing the produce, and I maintain that from a very small beginning it has now become a national industry, and will still increase if it only get the consideration it deserves. I need not say that these hands are paid much more than any other branch of agriculture, and I find that from 25 to 50 per cent. of the gross proceeds is spent in labour before the goods leave the growers' hands.

Mr. Mundella: Hundreds of thousands of hands, did you say?

Mr. Monro: Yes.

Mr. Mundella: Would you not rather say tens of thousands?

Mr. Monro: No. I prefer to say hundreds of thousands.

Another member of the deputation said he had paid £3800 in wages a year for the cultivation of 1000 acres of land; another gentleman said he paid £1000 a year for 6 acres of glass (?) another told Mr. Mundella that he paid £4000 a year for 500 acres, while a fourth gentleman said he paid £1000 last year for 90 acres.

Classification.

The last point, continued Mr. Monro, I shall touch on is the classification of hot-house produce. When our trade was in its infancy the railways had a perfect right to charge a fancy carriage on a few consignments of fancy value—as they were, say, twenty years ago—but what has happened since then? Our growers have with great energy and skill worked it up to what would have been thought an impossible extent, with the effect of lowering price and diminishing profits to a very small margin, so that this coming at a time of general depression is doubly hard, and I cannot see why articles of commerce running into hundreds of tons, should be placed in class 5, the highest possible class with such valuable and breakable articles as clocks and barometers. This is most unfair. I have reckoned one instance where a truck of hot-house produce comes to thirty per cent. more than a whole carriage with thirty third-class passengers, and they are all at the company's risk. Instance, Worthing third-class, fare 4*s.* 11½*d.*, carriage two-thirds full, thirty passengers at £7 18*s.* 9*d.* with a risk of say £3000, and they charge £10 10*s.* 4*d.* for a truck of hot-house produce weighing four tons, at 5¾ at a risk of not over £100, and this is not taking into account any luggage which the passengers are allowed to take with them free. I am sorry we have no means of getting at the actual figures to show the increase, but, if you will allow me, I will mention the increase on Channel Island produce last year, which was about 250,000 packages over 1891, or over 25 per cent. increase; and without counting any from the Channel Islands, my own firm sold over 260 tons of Grapes, over 700 tons of Tomatos, and about 250,000 dozen Cucumbers—all grown under glass. It seems utterly ridiculous to class these quantities with a few fancy articles of extreme value, especially when the many other articles used in the trade, such as bones, manure, &c., which traffic is a profit to the railways, are considered. Another instance of the development of trade is the Scilly Isles case, where, at this time of year, the consignments of flowers alone some days exceed 10 tons, and these, although grown out-of-doors, are in the same class (5) as hot-house-grown. In reference to increase in outdoor culture of fruit and vegetables, I am given to understand that in the last ten years the increase in fruit and vegetables amounts to nearly 100,000 acres.

Noticing with much gratification the firm attitude you have taken all through this agitation, we trust you will bear these grievances in mind, touching as they do vitally one of the few flourishing home industries. Referring to the question of classification, we think that all market produce grown under glass should be no higher than class 2.

Green Stuff and Potatos.

Mr. George Coleman said: I represent the interest of growers and salesmen of Potatos, green vegetables, &c., or what may essentially be called the food for the million. Under the new railway rates and classifications, Potatos have not been much affected on the northern lines; on the southern lines the rates have been raised from 1*s.* to 2*s.* 6*d.* per ton within 40 miles from London. But other vegetables have been raised from twenty-five to one hundred per cent. on the old rates, and as the market gardening and vegetable growing industry is being forced from the immediate vicinity of London, and in the future the larger portion of the supply for London must come by rail, the increase of rates, if enforced, must tend to make this branch of agriculture unremunerative, and our business as traders and distributors will suffer. We may also point out that vegetable growing employs more labour than ordinary farming, and the inhabitants of London will not get such an abundant supply of fresh vegetables at moderate prices. Vegetables being an important item of food (from an hygienic point of view), anything tending to increase the cost of production must claim the consideration of the authorities who deal with agricultural questions and the welfare of the people. We also point out that under the new arrangements, small senders are charged such high rates as against senders of one ton or upwards, that it is bound to close markets at a distance to them. We also think the system of charging, which includes collection and delivery, is wrong, as in almost all cases in agricultural districts the cartage is done by the sender, and therefore the company's charge should begin with the work done. We give you a few examples of enhanced rates for greenstuff. On the South-Eastern Railway, from Higham to London it was 8*s.* 4*d.*, now 16*s.* 3*d.*; Cliffe, 8*s.* 4*d.*, now 16*s.* 6*d.*; Sandwich, 15*s.*, now 26*s.* 8*d.* On the London and Chatham line, from Wrotham to London, 8*s.* 4*d.*, now 16*s.* 3*d.* Great Eastern Railway, Norwich to London, 10*s.*, now 16*s.* 8*d.*

Preference to Foreign Growers.

Mr. Monro said a lot of the trade was being driven abroad on account of these rates. A great industry had grown up in Belgium, and Grapes were now sent direct from Antwerp to London for 1*s.* a basket.

Mr. Mundella: What would be the cost in this country—say from Worthing to London?

Mr. Monro said the cost would be more than from Antwerp.

Mr. Mundella: You are aware that in giving preference to foreign over home goods the companies are acting distinctly contrary to the Act of 1888?

Mr. Monro asserted that what he was saying was correct, and added that while the rate for English Apples from Folkestone to London was 24*s.* 1*d.* per ton, French apples were brought from Boulogne to London for 15*s.* 8*d.* per ton.

Country Buyers.

Mr. Liddiard, speaking for the country buyers at Covent Garden, said that of the 63 different rates which had been sent to him by customers, only three had been reduced. The remaining 60 showed an increase of from 2 to 144 per cent. The old rate for Oranges and Lemons from Cornwall to London was 32*s.* 6*d.*, it was now 54*s.* 10*d.* These rates were very detrimental to trade, and produce was taken to Liverpool by boat on account of the lower rates. Many fruit traders in the country were compelled to buy their goods daily. In London the traders had the advantage of buying three times a week, but the country trader could not have 2 or 3 cwt. at a time, and consequently under the new regulations he was crippled by excessive charges. He understood he could not go into the question of classification.

Mr. Mundella: I should be very glad to receive any representations that are carefully put before me on the subject of classification without exaggeration, and that will bear the most rigid investigation. Be very careful what do you put before me, and we will give our attention to the subject.

Mr. Liddiard added that a customer at Halifax returned some Tomatos because he could not sell them, owing to the high rates; and he pointed out that, although some of the rates from Lowestoft seemed to have been lowered, such was not the case, because the reduced charge did not include delivery and collection, as was the case with the old charge. He concluded by expressing the hope that Mr. Mundella would do what he could to assist them.

The Reply of the President of the Board of Trade.

Mr. Mundella in reply said, when Mr. Smith applied to him to receive the deputation, he explained that he wished to discourage any more deputations, but when he came to look into the statements which were sent him, and to consider that the industries that were represented, he felt he was bound to receive them. He was glad to have heard the statements which had been made that day—they were very interesting to him, and they must be to the public. They all knew how important it was that a larger area of land should be brought under this kind of cultivation, from the larger number of workpeople who were employed on this industry, and that no greater benefit could accrue to the country than to encourage to the utmost possible extent the growing of vegetables, flowers, fruits, and other supplies for home consumption from our own land, instead of our being

compelled to import as much as we did from foreign countries. Of course we had certain disadvantages caused by our climate, but he gathered from them that they were endeavouring—he was glad to see successfully—to grapple with those disadvantages. That was shown by the fact that 1 ton of hot-house produce was raised as against 10 lbs. formerly. Surely, if the railway rates paid when only 10 lbs. were conveyed, they ought not now to be higher, but less; and there was no doubt that if the railway companies took an enlightened view, self-interest would prompt them to do all in their power to encourage and develop their industries. He could only say this, that he was quite sure no man who knew anything of the condition of trade in the country generally, and of agriculture—no man, whether in Parliament, or out of it—could fail to sympathise with, and wish success and prosperity to the industry with which they were connected. They had presented their case with great fullness, and, he believed, with great accuracy on the whole. and they had handed in a long list of specified charges and had given a great deal of interesting information. He thought with regard to the discrepancies between foreign and home charges, several statements had been made which were indicative of undue preference and distinctly contrary to the Act of Parliament. In that case there was nothing for it but an appeal to the Railway Commissioners.

A Member of the Deputation: That is too expensive.

Mr. Mundella: It was said that that was too expensive. They must see how that could be managed. Something ought to be done at any rate—he did not at that moment say how it was to be done—but something ought to be done whereby such appeals could be made cheap, prompt, and effective. It was not consistent with the intention of the Legislature or with sound policy that an appeal to the Commissioners should be so costly and that private traders should be prevented from encountering great organisations and great wealth in a court which was intended to protect the public. The Board of Trade had been doing, he was sure they must recognise the fact, since January 2, everything that possibly could be done to bring about a good understanding between the traders and the companies. They had urged upon the railway companies all the arguments which had been laid before them by the traders of the country, and they had stated that it was of the utmost importance that the companies should come to a good understanding with the traders, and that they should give the traders reasonable rates. The Board had not been altogether unsuccessful. A good deal had been done, "and," said Mr. Mundella, "let us make acknowledgments where they are due." He knew that personally he was very much blamed by the railway companies for using what they called strong language, but he was quite prepared to take the respansibility of his language and his acts. He thought the present was a case where his conduct was justified, and he had nothing to recant with respect to anything he had said, or with respect to anything he intended to do. He sincerely hoped that the railway companies would revert to reasonable rates. He knew the companies had been pressed on this matter, and he thought they had some grounds for complaint on that score, but he also thought they might have maintained the old rates pending the period of revision. Some of the companies were acting much more reasonably than others, and he was receiving letters from traders, thanking the Board of Trade for its services. Mr. Mundella then read a letter, dated February 28, from Mr. Sarle, of the London, Brighton, and South Coast Railway Co., which stated that the writer had seen the announcement that that deputation would wait upon the Board, and that he wished to say that the company was doing all it could to meet the requirements of the traders. He also read a letter from the Worthing Association, which was addressed to the Brighton Company, and which thanked that company for what it was doing.

Mr. Monro said the case referred to by Mr. Sarle was that at Worthing, in connection with which the traders pointed out to the company, that they would do their work by cartage.

Mr. Mundella would not say that the competition had nothing to do with the action of the company, but he might point out that the company had declared that they would carry out the reduction throughout their system. He wished there were more indications of that kind, but he did hope after the expression of opinion which the railway companies had had from Parliament, and which they were having every day from the public, and after the conviction that must be forced upon them that the present rates could not be maintained, they would at least revert to the old rates, and that they would with respect to such an important industry as theirs, try to meet them in a reasonable spirit. So far as the Board of Trade was concerned, they would convey to any company or railway association any complaint the traders might have. The documents that had been handed in should be sent to the companies, and he would ask the deputation still to be patient until the companies had had time to revise the rates. They were not to let the companies think that they were dealing with them in a harsh or unreasonable spirit. Sir Henry Oakley had promised that, whatever form the revision would take, the rebate would take effect from January 1, and if the rates were brought down to a reasonable standard, he hoped the Board would have done some service to the traders, and that they should be in a better position when the revision was completed, to see what future lay before them. Something had been said about a guarantee for the future. Well, the railway companies were passing through an experience which could not be agreeable to them, and if a satisfactory arrangement were arrived at they would not be in a hurry to encounter another storm such as that which was now passing over them, and which he trusted sincerely would pass away. He did feel, however, in this matter of revision of rates that it pressed particularly hard upon traders of the class of which the deputation was composed; when they wished to make an appeal to the Railway Commissioners, they could not do so except at great cost. This and other matters would be considered by the Board of Trade when the right time came, and he hoped they should be able to deal with them satisfactorily. A vote of thanks to the President concluded the proceedings.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Answers to Correspondents

To our Readers.—*The Editor begs leave to solicit from the readers and contributors to the Gardeners' Chronicle:—*

Short Practical Notes on Cultural Matters;

Early Intelligence of Local News likely to be of general interest;

Notes and Memoranda useful to the Trade;

Specimens of New or Interesting Plants, Fruits, &c.;

Drawings or Photographs of Gardens, Trees, Flowers, &c., and which if suitable for reproduction will be utilised so far as possible.

Barometer: *T. Y. D.* If your aneroid has a scale of feet as most of them now have, read your aneroid at sea level, and as soon as possible thereafter at your residence. By subtracting the height in feet at the lower station from that at the upper, you will obtain a product which (allowing for temperature) will give you the height of your residence approximately; or, get a friend to note the height of the barometer and temperature at sea-level at a fixed time, and you make a similar observation at your residence at the same time, you will thus obtain the same result, but in this case you require to compare the working of the two barometers to see that they are uniform in their action, or to make the necessary corrections if they are not so. To be more accurate, you require to know the mean temperature of the two stations at the time of observation. Consult Buchan's Introductory Text Book of Meteorology (Blackwood & Sons), or Tyas Weather Glass (Bemrose & Son). The ordnance map of your district would probably show the height of your locality.

Books Received: *Primer of Horticulture*, by J. Wright. London, Macmillan & Co.

Cineraria: *J. A. A.* A fine bloom with regular markings, but there are many as good, and as large, if that be a desirable feature in Cinerarias.

Correction.—In Gardening Appointments in *Gardeners' Chronicle*, February 25, for Clynnthorpe read Gunthorpe.

French Beans: *A. P.* These vegetables may be grown in spring and early summer, also in September and October, in cold frames. The three-quarter span frame, enclosing as it does more space than an ordinary one, would answer well for Beans. It will be necessary to dig the ground deeply after affording it a dressing of farmyard manure if it be very poor, or leaf-mould, old Mushroom bed material, and superphosphate of lime. Manures that cause much leaf growth are better avoided. Rich soil should not be manured at all for Beans. When the land has settled somewhat, trample it evenly all over, rake off the big stones, and level it. Place the frame upon it, with the slope of the same southwards; and if it be not deep enough when the plants are full grown, raise it at the corners on bricks, and put sods, or pieces of board, tile, &c., to close the space at the bottom. Sow, that is dibble, in the seed 3 inches deep and apart, in lines 1½ foot asunder for dwarf varieties, such as Osborne's Forcing, Sion House, White Flageolet, and Black-seeded Belgian; and 2 feet apart for taller growers. If a bed of warm manure, of, say, 2 feet thick, were put under the earlier sowings, it would be of great advantage in getting the seed to start without loss of time. After the Beans have vegetated, the temperature of the frame should never be allowed to fall below 50°, or the plants will do no good, and remember that they require full sunlight, and plenty of air.

Grafting Golden Yew on the Common Species: *W. M.* The operation may be done in the spring as soon as growth begins, with ripened shoots of the previous year, or in August with shoots of the current year. The method employed may be that known as the veneer or whip, and the stock and scion need not be tongued; indeed, if these are weak it is undesirable to tongue. The leaves may be cut off both stock and scion, where the ligature will be placed; but, on stock and scion these should be retained at the top. Cut the scion, which should be quite fresh (not more than 24 hours cut), with an even sloping surface; measure its width and length, marking these out on the rind of the stock, and shave away the bark, and if necessary the wood, trying the scion on the surface from time to time till the two fit accurately

at the edges. Tie them together with soft thread or bast, and coat the parts with grafting wax to prevent evaporation from the tisaues. When the union is complete, the stock should be cut back with a cut sloping away from, and at a point where the two begin to unite. This method of grafting is suitable for evergreens generally, and is good outside or under hand-lights, bell-glasses, double frames, &c. Under glass, the grafting wax is less needed.

Hyacinth badly developed: *W. F. Gunn & Co.* This may be the result of the bulbs having been kept too long or in an unfit store. Many such cases arise from bulbs having been harvested before fully matured.

Making Mushroom Spawn: *D. F.* It is made of a certain proportion of cow-dung, horse-dung from animals fed on hard food, loam, and enough water to form a thick pasty mass. It is then partly dried, and afterwards clamped or stacked in sufficient bulk to set up a gentle heat, the "spawn" being thus generated within the so-called "bricks." If you want to ascertain the exact methods of setting to work commercially in the manufacture of bricks, an insight into the methods adopted by the best makers should be obtained.

Melon: *A. P.* We much doubt your ability to cultivate Melons of edible quality in a cold frame. In this country it can only be attained by the use of bottom-heat, steady, and lasting for twelve to fifteen weeks at 75° to 80°, with an average top-heat of 10° less. The shape of the frame does not matter greatly, but we should prefer one having a simple slope to the south before a three-quarter span, and it should not be less than 6 feet from back to front.

Muscat Champion Grape: *W.* We have received from "Vagabond" a note explaining the manner in which the mistake of writing Mr. Meredith's name instead of Mr. Melville's occurred, and this appears to us so likely to have been as he says, that we are of the opinion that the matter may now be allowed to drop.

Names of Fruits: *W. Milford.* Pears should have been sent earlier. They are now past identification.

Names of Plants: *H. & S.* Hedera crenata baccifera major.—*Lea Green.* Tradescantia Warscewicziana.—*H. F. M.* 1, Clematis indivisa; 2, Dracæna congesta; 3, D. intermedia; 4, Camellia Sacco-inova; 5, Abutilon insigne; 6, Cratægus Pyracantha.—*J. Machar.* The yellow one is Oncidium Cavendishianum, and the darker one O. luridum. In parts of South America they may be found growing together.—*H. F.* Acacia longifolia.—*W. C. & Sons.* Spiræa sorbifolia.—*J. R.* 1, Pinus Lambertiana (probably); 2, Picea excelsa; 3, Berberis Thunbergii; 4, Mesembryanthemum sp. (send when in flower); 5, Rhododendron Cunningham's White.—*F. A. G.* 1, Fuchsia, next week; 2, Cineraria Petasitis.

The Scotch Pine: *J. B.* In some parts of Scotland this is no doubt truly indigenous. Consult the report of the Scottish Conifers in the Conifer report of the Royal Horticultural Society.

Trees: *T.* It would be endless work to hunt up all the references in the *Gardeners' Chronicle.* Perhaps Mr. Boulger's book on familiar trees would answer your purpose.

LARGELY INCREASED CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of 75 per cent.

Advertisers are also reminded that the "Chronicle" circulates among ALL CLASSES OF GARDENERS AND GARDEN-LOVERS *at home, has a specially large foreign and colonial circulation, and is preserved for reference in all the principal Libraries.*

Williams'
Shading Materials.

THE MOST SUITABLE FOR
SHADING ORCHIDS, FERNS,
Palms, and Stove and
GREENHOUSE PLANTS.

WILLIAMS' HOTHOUSE SHADING.

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.

It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. The leading Orchid and Plant Growers in the country have used this material for some years, and speak very highly of it, pronouncing it to be the very best material for Plants they have ever used.

Blinds made up and fixed complete.

Sold in pieces, 30 yards long by 1¼ yard wide. Price 40s. each. Samples submitted gratis.

WILLIAMS' "EUREKA" SHADING. *Regtd.*

This new shading is in the form of a white powder, and is prepared for use by applying boiling water to the compound, and allowing it to cool, when it can be applied by means of a brush. It dries instantaneously, and can be rubbed off easily when moist. This shading may be used for GREENHOUSES, SKYLIGHTS, WINDOWS, &c.

Sold in 1-lb. packets, with directions for use, price 1s. each. 1 lb. free by parcel post for 1s. 4½d.

2 lb. free by parcel post for 2s. 6d.

Each packet will make half a gallon of shading material when mixed. It is a great improvement on anything hitherto offered, and lasts the whole season.

Designs and Estimates Free, and Measurements taken Free of Cost.

HEATING OF

ALL KINDS.

Testimonials.

"Shirburn Castle, January 5, 1890.

"Sir,—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) Macclesfield."

"Hornby Castle, Lancaster, February, 1890.

"Major Foster has much pleasure in stating that the vineries and forcing-houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.

"Sir Henry Ingilby has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep it in repair."

The Patent Silicate Manure for Early Potatos.

The striking effects our Silicate has produced on Tomatos are seen on POTATOS as regards their EARLY MATURITY.

Fordingbridge, Hants, *September* 2, 1892.

DEAR SIR,—I can speak of your Silicate in terms of unqualified praise. I tried it especially on two beds or plots of Myatt's Ashleaf Kidney Potatos, side by side with two beds not so treated, with the result of more than **25 per cent. increase** in measure, and although not one of the earliest varieties of Potatos, was able to dig good sized tubers eight weeks after planting. Some roots yielded as many as twenty-six tubers fit for table, scarcely any falling under twenty. (Signed) G. PARBERY.

Prices in Sacks at Works:—10s. per Cwt.; £2 per ¼ Ton; £3 15s. per ½ Ton; £7 per Ton.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

TO GARDENERS, &c.—Young Man (age 24), requires situation in Tomato or Cucumber-houses. Has had Charge of Tomatos. — A. B., 1A, Friern Park, North Finchley, London, N.

TO GARDENERS.—Advertiser (age 20) seeks a situation in Kitchen Garden.—Good references from last and previous situations.—G. H., the Chestnuts, Weybridge, Surrey.

TO GARDENERS.—H. APPLEBY, Dorking, Surrey, can confidently recommend A. Weller as FOREMAN in a good Establishment; age 26. Seven years' good character.—A. WELLER, jun., Holmwood Park, Dorking, Surrey.

TO MARKET GROWERS.—Situation wanted by one who has been in a Gentleman's garden for three and a half years. Can be well recommended. Age 19. Strong and active.—A. WOOD, 12, New Street, Three Bridges.

TO MARKET GROWERS.—A young Man (age 24) seeks situation with above. Eleven years' experience; good references.—J. T. CREED, 2, Costerton Terrace, North Lane, Teddington.

SALESMAN.—Engagement wanted by man with large and varied experience in London Markets. Age 29; thorough knowledge of all Plants and Flowers, and their value. Character and integrity open to strictest investigation.—FLORA, 41, Wellington Street, Strand, W.C.

SALESMAN, either in Plants or Cut Bloom, in Manchester or Liverpool Market.—Several years' experience in Covent Garden Market. Good references.—W. H., 47, Lichfield Grove, Church End, Finchley.

TO FLORISTS and SEEDSMEN.—Situation wanted, by a young man, as an ASSISTANT. Good experience with Seeds, Plants, Bulbs, Cut Flowers, &c.—PRIMULA, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO FLORISTS.—A young Lady desires re-engagement; well up in all branches; first-class references. —FLORIST, 14, Clarendon Road, West Green, Tottenham.

HOLLOWAY'S OINTMENT and PILLS.—Much watchfulness must be exercised at the present time, and the earliest evidences of ill-health must be immediately checked, or a slight illness may result in a serious malady. Relaxed and sore throats, dyptheria, quinsey, coughs, chronic cough, bronchitis, and most other pulmonary affections will be relieved by rubbing this cooling Ointment into the skin as near as practicable to the seat of mischief. This treatment, so simple and effective, is admirably adapted for the removal of these diseases during infancy and youth. Old asthmatic invalids will derive marvellous relief from the use of Holloway's remedies, which have brought round many such sufferers, and re-established health after every other means have signally failed.

GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH"

ROLLING AND COLLECTING MACHINES FOR 1893.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in **constant** *use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.*

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.

They are the first, foremost, and best in the world.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "*Journal of Horticulture*," *of June 9, says:*—"MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 195,000 of these Machines have been Sold since they were first introduced in the year 1856,
And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.
They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains and Handles.

To cut 6 in., can be worked by a Lady ...	£1	15 0
To cut 8 in., do. do.	2	10 0
To cut 10 in., do. by a strong youth	3	10 0
To cut 12 in., do. by a man ...	4	10 0
To cut 14 in., do. do. ...	5	10 0

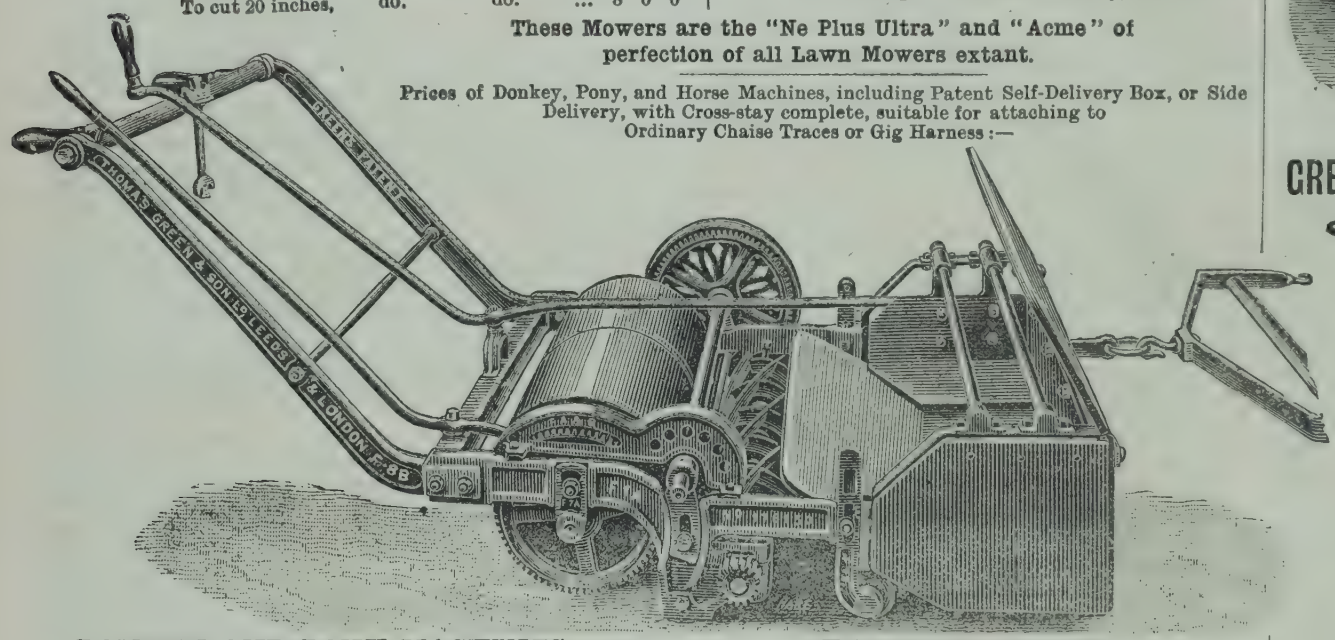
We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man on even lawn ...	£6	10 0
To cut 18 inches, do. man and boy...	7	10 0
To cut 20 inches, do. do. ...	8	0 0
*To cut 22 inches, can be worked by two men	£8	10 0
*To cut 24 inches, do. do. ...	9	0 0

* If made stronger, suitable for Donkey, 30*s.* extra.

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.



Prices of Donkey, Pony, and Horse Machines, including Patent Self-Delivery Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY AND PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

REDUCED PRICES OF

Margate.—By order of Executors.

CLEARANCE SALE of STOVE and GREENHOUSE PLANTS, PITCHER PLANTS, ORCHIDS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, Albert House, Margate, on THURSDAY, March 23, at 1 o'Clock precisely, by order of Executors of the late — Atkinson, Esq., the choice collection of STOVE and GREENHOUSE FERNS, amongst which are two fine Cibotium Scheidei; PALMS in variety, a very fine lot of CROTONS, DRACÆNAS, ALLAMANDAS, STEPHANOTIS, large CAMELLIAS, TEA ROSES, ACHIMENES, GLOXINIAS, CYCLAMEN, PANCRATIUMS, IMANTOPHYLLUM. 100 very fine Seedling AMARYLLIS, a few ORCHIDS, including Cypripediums and Dendrobium, Phalænopsis; a very choice collection of NEPENTHES, including Morganiæ; with 20 PITCHERS, Hookeriana; 15 PITCHERS Ratcliffiana, Wrigleyii, cincta, and others.

May be Viewed two days prior to the Sale. Catalogues had on the Premises, of Messrs. Jackson & Wright, Solicitors, 60, Lincoln's Inn Fields, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Friday Next.

By order of Messrs. Linden, Brussels.

A grand Lot of 150 Established Plants, all unflowered, of

LINDEN'S CATTLEYA REX

will be offered for SALE by PUBLIC AUCTION at MESSRS. PROTHEROE AND MORRIS' Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, March 17, at half-past 12 o'Clock.

Since Messrs. Linden have introduced this most brilliant ORCHID, another firm announces periodically that they "will offer Cattleya Rex soon."

In one of the recent issues of the *Gardeners' Chronicle* (February 18, 1893, p. 187), an announcement appeared under this form—that "Cattleya Rex comes from the Kayman River (?) territory, interior of the U. S. Colombia, towards Bolivia."

LINDEN'S CATTLEYA REX is NOT a native of U. S. Colombia. Its native habitat will in due time be revealed by Messrs. Linden.

Also 100 Selected Plants of
ODONTOGLOSSUM (COCHLIODA) NOTZLIANUM.
And 50 well-established Plants of
MESOSPINIDIUM VULCANICUM GRANDIFLORUM.

On view morning of Sale, and Catalogues had.

The Quorn House Collection of Orchids.

LOUGHBOROUGH.

Also the COLLECTION of PITCHER PLANTS, probably the finest in Europe.

Highly important CLEARANCE SALE, by order of W. E. J. B. Farnham, Esq. Without the slightest Reserve.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL by AUCTION, on the Premises, Quorn House, Loughborough, on TUESDAY, April 11, and FOLLOWING DAYS, at 12 o'Clock precisely each day, the whole of this far-famed Collection of ESTABLISHED ORCHIDS, splendidly grown, and containing many rarities. A list of the principal plants appeared in last week's *Gardeners' Chronicle*.

Catalogues are being prepared, and may be had in a few days.

To Nurserymen and Florists.

Jubilee Nursery, Lordship Lane, Wood Green, N.

A 60 feet by 14 feet timber-built GREENHOUSE, with Piping; a 29 feet by 14 feet ditto, with Piping and Staging; a 13 feet by 10 ditto, with Staging; 19 Sheets of GALVANISED IRON; an Iron Water TANK, 5 feet 4 inches by 3 feet by 3 feet; and 14 PIT LIGHTS.

MR. WILLIAM J. PALMER will SELL the above by AUCTION, at the Wood Green Mart, opposite Green Lanes Station, G.E.R. (a Sale on the Premises being prohibited), on THURSDAY, March 16, at 1 o'Clock precisely. May be viewed.

W. J. PALMER, Auctioneer, Wood Green, N.

ODONTOGLOSSUM ALEXANDRÆ.

THE FINEST TYPE.

Collected under the auspices of Mr. John Carder (late of the firm of Shuttleworth, Carder, & Co.), from whence all the best spotted forms have arisen.

OUR GRAND SPRING IMPORTATION will arrive at Southampton on March 22, therefore we are anxious to book orders. The price will be from 10*s.* 6*d.* per dozen, and upwards. *We can now book cases to arrive at Southampton*, each case containing from 400 to 500 plants (the price can be arranged privately, but we will say this, that on the cases being opened, should they look doubtful, they will not be forwarded).

The cases will number from a to z, so that our customers can make their own selection, as we know no special case.

Dealers in Virgin Cork, Raffia, Bamboo Canes, Garden Sticks, Palm Seeds, &c.

CARNATIONS.—Reynolds Hole, 25s.; Germania, 6ds.; Old Crimson Clove, and Salisbury (white Clove), 12s. 6d.; Merry Andrew (yellow-cerise), 48s.; Bride, 50s.; Mary Morris, 50s.; Raby (pink), 20s. per 100. Double Primroses, crimson-velvet (Madame Pompadour), 6ds.; White, 10s. 6d.; Lilac, 12s.; Cloth of Gold, 40s.; Salmon, 6ds.; Marie Crousse, 36s.; Paddy, 35s.; Sulphur, 20s.; Blue Polyanthus, 30s.; Hose-in-Hose, white and red, 12s. per 100. Named Pyrethrums, Phloxes, Pæonies, and Herbaceous Plants. Lists.
HOPKINS, Mere, Knutsford.

To the Trade.
SEED POTATOS.

H. AND F. SHARPE have still to offer all the best kinds of SEED POTATOS, grown on their own farms, from fine selected stocks. Special prices may be had on application.
SEED GROWING ESTABLISHMENT, WISBECH.

G. C. PRIZE PACKETS, 4s. each, two for 7s., three for 20s., contain 12 finest hybridised SOMERSET SEEDLING GLADIOLI, new and distinct varieties. Also Seedling CARNATIONS and PICOTEES, double border varieties, strong, 2s. 6d. per dozen, all post-free. P.O. or stamps.
R. H. POYNTER, Nurseryman, Taunton.

DOUBLE GORSE.

FINE STURDY PLANTS.
A large quantity, established in Pots.
Ready for Sale. Prices on application.

DICKSONS NURSERIES, CHESTER.

HENRY ECKFORD, WEM, SALOP.

SPECIALTIES—SWEET PEAS.

CULINARY PEAS. Choice PRIMULA SINENSIS, Superb CINERARIA; PANSY, Show and Fancy, very grand large-flowered strain.
POTATO SHARPE'S VICTOR, true yellow-fleshed variety, per cwt., 10s.; per peck, 2s.
Descriptive Catalogue, post-free.

THE MOST SUITABLE FOR
SHADING ORCHIDS, FERNS,
Palms, and Stove and
GREENHOUSE PLANTS.

WILLIAMS' HOTHOUSE SHADING.

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading. It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. The leading Orchid and Plant Growers in the country have used this material for some years, and speak very highly of it, pronouncing it to be the very best material for Plants they have ever used.
Blinds made up and fixed complete.
Sold in pieces, 30 yards long by 1½ yard wide. Price 40s. each. Samples submitted gratis.

FRIDAY, MARCH 17 Next. **By Order of Messrs. LINDEN, BRUSSELS.**

A GRAND LOT OF 150 ESTABLISHED PLANTS, ALL UNFLOWERED, OF

LINDEN'S CATTLEYA REX,

WILL BE OFFERED FOR SALE BY PUBLIC AUCTION, by

Messrs. Protheroe & Morris,

AT THEIR
CENTRAL SALE ROOMS,
67 & 68, CHEAPSIDE, LONDON, E.C.,

AT HALF-PAST 12 O'CLOCK PRECISELY.

Since MESSRS. LINDEN have introduced this *Most Brilliant Orchid*, another firm announces periodically that they "*will offer Cattleya Rex soon.*" The same has been awaited for three years ! ! !

In one of the recent issues of the *Gardeners' Chronicle* (February 18, 1893, p. 187), this announcement has been renewed under this form: "*That Cattleya Rex comes from the Kayman River (?) territory, interior of the U. S. Colombia, towards Bolivia.*" Something new for geographers; where have Ecuador, Peru, or Brazil gone? Have they been swallowed by the "*Kayman*" ?

LINDEN'S CATTLEYA REX is not a native of U. S. Colombia. This statement is conscientiously affirmed, and its native habitat will, in due time, be revealed by MESSRS. LINDEN; consequently, the Cattleya to be "soon offered" by another firm, is not LINDEN'S CATTLEYA REX.

B. S. WILLIAMS & SON

UPPER HOLLOWAY, LONDON, N.

THE

Gardeners' Chronicle.

SATURDAY, MARCH 11, 1893.

CALIFORNIA.

MR. MALCOLMSON, a native of Aberdeen, but settled in California, and now on a visit to his old home, communicates his experiences as follows:—"The great industry of California to-day, and one that in a few years will overshadow all others, is fruit-growing. While fruit has been grown in the States for over a century, having been introduced by the Mission Fathers over a hundred years ago in the southern part of the State, and by the Russian traders early in the present century in the northern portion, it is only during the past twenty years that any rapid progress has been made in this direction. But in that time California has forced her way ahead of all other States in the Union, until she is to-day the garden and orchard of the world. With a continually widening market for our orchard products, with stories of fabulous returns from investments in fruit-farms, it is natural that people of small means, desirous of making a home and an income, should seek for information in regard to it. To this class of my countrymen I have much pleasure in giving the following particulars, and I think the information I give can be relied upon as authentic, I myself being one of the largest Raisin-vine growers in the State, and owning a vineyard of over 160 acres. The intending settler will naturally ask—'What assurance have I that my investment will be permanent as well as profitable? What are the causes that make California superior to other parts of the United States as a fruit producer? Will not other portions of America enter into competition with us, and overstock the market, and thus make our investment unprofitable, and our labour a failure?' These doubts will quickly disappear with a knowledge of the advantages that California enjoys. These are climate, geographical position, and physical peculiarities. While descriptions of California's climate have become a household word, it is, nevertheless, the one great cause of its superiority as a fruit section, and its climate depends upon its geographical position. California's position also gives it the world for a market; and while, with the continually-increasing home market, it is now beginning to ship large quantities of fruit to Australia, China, Japan, and India, and within the last few months shipments of fruit have been made to Great Britain. With, therefore, the United States and the rest of the world for a market, and the constantly-developing taste for Californian luscious fruits, there is no danger of over-production.

"To give some idea of the profits that can be made out of fruit-growing, I shall cite one or two instances which will go to show what one may expect for his labour and capital on only a moderate-sized orchard in California. Major

*

Robert H. Nolton, formerly a railroad employé, nine years ago purchased the Mountain View Orchard, at Vernondale, consisting of 19 acres. It had been planted in fruit six or seven years before. He manages everything with railroad precision and neatness, and the following is his report from December, 1890, to December, 1891. (I give Major Nolton's report as an example of the various kinds of fruits that can be grown on such a small orchard as 19 acres, and the net results will, no doubt, startle many readers):—

Income.	£	s.	d.
2,500 boxes of Oranges	500	0	0
1,500 boxes of Lemons	400	0	0
37,000 lb. of Peaches	148	0	0
2,000 lb. of Pears	8	0	0
3,500 lb. of Apples	24	0	0
1,000 lb. of Walnuts	16	0	0
500 lb. of Crab-apples	2	0	0
400 lb. of Nectarines	2	0	0
	£1100	0	0

Expenses.	£	s.	d.
Two men employed	146	0	0
Hay and grain for three horses	54	0	0
Taxes	24	0	0
Family and domestic expenses	248	0	0
Net income over all expenses	629	0	0
	£1100	0	0

"Major Nolton's family consisted of six. In this report no account is made of eggs, fowls, and two cows, the returns being consumed; but at a glance it will be seen that the handsome return of £629 was netted off such a small orchard as 19 acres.

"As another illustration, I quote the returns of a property near my own—that of the late Mr. F. R. Storie, an Aberdonian:—'My gross receipts from 4 acres of Peaches amounted to £206. Among Pears, I consider the Bartlett (Williams' Bon Chrétien) the best variety. From 1½ acres of young trees I took off £25 worth of fruit. Nectarines are a very good crop, bearing and paying well. I have netted £20 an acre on this fruit. Apricots pay from £25 to £30. French Prunes do very well, and from 4½ acres of this fruit I received £200. With a judicious selection of fruit trees there is much money in fruit.'

"Both of these accounts are very satisfactory, and it must not be forgotten that both Major Nolton's and Mr. Storie's orchards are still young, and that the older trees become, the heavier will be the returns. In giving such instances as these, although these are only two out of thousands, I do not wish readers to think that such results can be attained immediately on a settler's arrival in California, unless he is in a position to purchase outright an improved orchard or vineyard. Long weary months of anxiety and labour are necessary before either a vineyard or an orchard can yield such returns as the two cited. Still, in no part of the world can a man so soon see the result of his labour as in California, and in a very few months from the time of his going on to what may be considered a waste and useless piece of land, it can be transformed into a veritable paradise. As an instance of this, I may, *en passant*, cite my own vineyard, of which I took possession some four years ago in a desert state. Within some sixty days I had the whole 160 acres ploughed over twice, to a depth of 18 inches, and carefully harrowed, the whole planted with some 70,000 Vines, 10 feet by 8 feet apart; some 5 miles of rods and avenues laid out, whilst on the borders of the avenues I planted, alternately, Fig and Olive trees. In that time I also constructed some 7 or 8 miles of irrigating ditches and canals; enclosed the whole property under close wire fence; erected suitable buildings, stables, and coach-house; and planted an orchard consisting of no fewer than twenty-nine different varieties of fruits, and a Vine arbour of some twenty varieties of Grape Vines; whilst, as an adornment to the residence, I laid out a lawn and flower-garden. So that within the short space of three months [Is there not some mistake here? Ed.] I had transformed into one of the most promising vineyards in California a piece of land which only sixty days previous might have been considered a barren piece of waste and useless land. This will give some idea of the forcing nature of the soil, and the magnificence of the climate of California.

"With such results as these, it is only but natural that the intending settler should wish to know what capital is required for the opening up and bringing into successful bearing a vineyard or an orchard. This, of course, is largely determined by the amount of capital he has available for investment; but my advice—with the experience I have had—is that it is better to own a well-kept 20-acre orchard or vineyard, than a 40-acre tract poorly attended to owing to lack of sufficient capital. But assuming the settler to have sufficient capital to open up and properly cultivate a 20-acre orchard or vineyard, until it begins to yield him a return—which cannot be calculated sooner than three or four years—I estimate that he should possess at least £500. With this sum, and provided he is willing to work, he ought, in the course of four or five years, to be in an independent position. With such a sum to commence with, he will be in a position to pay a portion of the price of his land, built himself a modest house, erect a barn, stable, and fowl-house, and purchase all requisites necessary for making himself a comfortable home; and should he be further blessed with a thrifty wife, it will be no time before he is enjoying himself, with her help, under his own Vine and Fig tree. Although I mention this sum as necessary for the intending settler to possess before proceeding to California, I could enumerate hundreds of instances where I have known men landing in California without any other capital than their own labour, and working themselves (with the help of a wife) up to such a position as to be able, through savings and economy, to own an orchard or a vineyard within a few years of their arrival. In no country in the world can a man who is willing and anxious to get on, be so successful as in the golden State of California . . . . . In this account I have given of California and its possibilities as a field for emigration, I refer especially to those who are willing and anxious to work, and who are at the same time not afraid to put their shoulder to the wheel. I do not wish readers to imagine that my description has been overdrawn, or that I have been carried away in my statements, as is generally credited to the ordinary American."

Mr. Malcolmson intends, through the influence of some of the most prominent citizens of Aberdeen, to arrange for the purchase of a most desirable tract of land, of some 16,500 acres, known as the San Fernando Ranche, near the city of Los Angeles, in Southern California, and to colonise the same with a thrifty lot of Scotchmen.

New or Noteworthy Plants.

DENDROBIUM (HYBRIDUM) VENUS.

"This handsome hybrid was raised in the collection of Norman C. Cookson, Esq., of Oakwood, Wylam-on-Tyne, and flowered for the first time in April, 1890. It is not so strong a grower as D. nobile; in fact, it has retained some of the characters of D. Falconeri both in habit and foliage, while in the flower the same influence is also apparent, though the yellow disc of that species is absent, as in D. nobile. The flowers are very large and handsome, and as the plant is a free grower and very floriferous, it is likely to become a favourite garden-plant. It is one of the most promising hybrid Dendrobiums yet raised." *R., in Reichenbachia, t.* 50. It is a hybrid from D. Falconeri by D. nobile, and was described by Mr. Rolfe in our columns, 1890, i., 608.

Dendrobium (hybridum) Cassiope.

A hybrid raised out of Dendrobium japonicum by Dendrobium nobile albiflorum, and intermediate in character. In colour it approaches D. euosmum. From D. endocharis it differs in the larger flowers and the maroon blotch on the lip. D. Cassiope is a free-flowering variety, with pure white flowers, the throat having a deep maroon blotch. It was described by Mr. Rolfe, in *Gardeners' Chronicle*, 1890, ii., 620; *Reichenbachia*, t. 50.

Lachenalia aurea gigantea.

Received as an imported bulb, collected in a new district, this fine Lachenalia has flowered in the gardens of R. A. Todd, Esq., Honeyden, Foots Cray, Kent. The stout flower-spikes are over a foot in height, bearing rich orange-coloured flowers for two-thirds of their length. The whole plant, flowers included, are much larger than those of the variety hitherto in cultivation, and the recurved petals peculiar to the species are larger and more showy. It is a frequent thing to hear L. Nelsoni spoken of as superior to L. aurea, but compared with the large form of it, of which Mr. Todd sends an inflorescence, it is a long way behind.

NEW ORCHIDS.

Cattleya Trianæ Broomeana, *new var.*

Since the great influx of new varieties in the large importations of C. labiata Trianæ some years ago, it having been but little imported lately, it is seldom we see a really distinct form worth recording; but the present one, which was purchased by Joseph Broome, Esq., Sunny Hill, Llandudno, the High Sheriff of Carnarvonshire, as an imported plant at Messrs. Protheroe & Morris' Rooms, is a well-marked and fine form. The flower is fine in shape, and of very thick texture; the sepals, petals, and base of the labellum nearly white when seen at a short distance, but a nearer view discloses a pearly-blush tint over the whole. From the base of the lip springs a divided orange-coloured feather-like tinge, and from the divided middle of it the rich, glowing, light mauve-crimson colouring fills up the whole of the front portion of the lip, which is plain-edged, and without the lighter margin usually seen in the varieties of this plant. Its form is of the best, and the colouring very brilliant, the under-side of the lip being almost as bright as the surface. The sepals are broad and flat, 3½ inches long; the petals 7 inches from tip to tip, each being 2½ inches wide. *James O'Brien.*

We extract the following particulars from the fourth decade of New Orchids described by Mr. Rolfe and published in the January number of the *Kew Bulletin*, which was issued early in February.

Pleurothallis rhombipetala.

This species was introduced from Mount Roraima by Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, with whom it flowered last December. It bears lax racemes of flowers, the sepals pale green, with dull purple spots on the dorsal one; the petals are dull maroon-purple, and the lip pale green, with a few dark purple spots on the margin. It is allied to the Brazilian P. arcuata Lindl., and is chiefly of botanical interest (p. 4).

Brachionidium Sherringii.

An interesting addition to this singular little genus. It was discovered by R. V. Sherring, Esq., growing on a tree, exposed to sun and wind, at Fedon's Camp, at 2400 feet elevation, in the island of Grenada, West Indies. It is described from dried specimens.

Fig. 41.—GLADIOLUS OPPOSITIFLORUS: FLOWERS WHITE.
(The arrow shows the exact width of the spike.)

A fact worth noting is, that the three previously recorded species are all natives of the Andes. The nearest ally of this genus is Masdevallia (p. 4).

Bulbophyllum Sanderianum.

A species introduced from Pernambuco, Brazil, with Cattleya labiata and other Orchids, by Messrs. F. Sander & Co., of St. Albans, with whom it flowered last July. It bears long racemes of flowers, the sepals pale green, with small brown spots; the petals white, with a purple margin and a few similar spots, the very hairy lip being deep purple-brown (p. 4).

Bulbophyllum vitiense.

Was sent to Kew by Mr. Daniel Yeoward, of the Botanical Station, Fiji. Its flowers are pale yellowish-white, with the upper half of the sepals light pink. It blooms in August. B. rostriceps, Rchb. f., is the only other species known from Fiji (p. 5).

Megaclinium minutum

was sent to Kew by G. F. Scott Elliot, Esq., from Sugarloaf Mountain, Sierra Leone, where it grows at 3000 feet elevation. The curiously flattened rachis is purple-brown, and the flowers dull maroon and greenish-yellow. It is the smallest known species of this genus, being only about 2 inches high (p. 5).

Phaius roseus.

This very distinct and pretty Phaius was collected by the Right Hon. Earl of Scarborough, in whose collection it flowered last December. It is believed to be a native of West Tropical Africa. The flowers are of a delicate shade of rose, the lip marbled with white spots, the disc with a hairy keel, and the spur deep yellow. In fading, the flowers pass to light orange-buff (p. 6).

GLADIOLUS OPPOSITIFLORUS.

The re-introduction of this species of Gladiolus to Kew, where it flowered in the Cape-house last December (see Dec. 17, 1892, p. 729), will enable bulb growers to decide the question of the origin of G. Gandavensis. This fine hybrid is supposed, by some authorities, to be derived from G. oppositiflorus and G. psittacinus (natalensis), and by others from the latter species and G. cardinalis. According to Dean Herbert, G. Gandavensis was raised in 1837, and by crossing it with others such as G. blandus and G. ramosus, the present fine race of garden Gladioli, of which Mr. Kelway is the champion grower, was originated, chiefly in France. G. oppositiflorus owes its name to a fancy peculiarity in the arrangement of the flowers upon the spike, but none of the plants which flowered last year at Kew differed in this respect from the ordinary Gladioli. It might have been appropriately named G. giganteus, or G. elatior, as in stature it is exceptional, the tallest of the Kew plants measuring over 6 feet in height, and they certainly were not drawn. Whether the species is one of the parents of G. Gandavensis or not, there is a close resemblance between the two in general characters, such as corm, form and texture of leaves, thickness of scape, and in the arrangement, form, and size of the flowers. The topmost 2 feet of the spike was clothed with flowers, each of which, when fully opened, was 2½ inches across, the segments wavy and recurved, pure white, with pencillings of bright amethyst-purple. In some of the plants the flowers were wholly tinged with pink, and the pencilling also varied. The flowers were not all open together, but perhaps half-a-dozen on each spike would be perfect, whilst those below were more or less faded, and the upper ones on the point of opening. The corms were received from Professor MacOwan, of Cape Town, in July. They were at once planted in sand, in a warm-house, and as soon as the roots showed, they were planted in rich soil in pots, and placed in a cold greenhouse. This treatment was the means of saving the corms, which, when they arrived, were badly affected with dry rot. A few of the corms have lately been distributed from Kew among cultivators specially interested in Gladioli. Attempts were made at Kew to cross G. oppositiflorus with other kinds, but owing, probably, to fogs and bad weather generally, none of the flowers set. *W. W.*

The Rosery.

AMONG THE ROSES.

From a few days before Christmas until the latter end of January we had very trying weather for Roses. Many of mine that are upon an east wall are looking badly. I do not attribute this to the low readings we had (although they reached 26° of frost, and often fell below 20°) so much as to the manner in which the frozen plants were thawed. The little snow we had, during a state of semi-thaw, slipped to the bottom of the roof, was arrested by the shoot, and formed a mass of ice which, for some days, dripped on to the plants below. With the sun shining upon the plants, and this exceedingly cold water dripping upon them at the same time, I find that my plants in the open ground are less affected by the frost than those upon a wall. The dormant buds that I wrote about some few weeks back, and which were imbedded in ice, came through the ordeal in a surprising manner. Among plants I find the following have suffered most:— Climbing Niphetos, Madame de Watteville, A. K. Williams, Prince Arthur, Souvenir d'Elise Vardon, Victor Verdier (always tender with me), Belle Lyonnaise, Bessie Johnson, La Boule d'Or, Catherine Mermet (The Bride, a sport from this, seems much hardier), Madame C. Wood, François Michelon, Princess of Wales, Lady Mary Fitzwilliam, and its sports, Ethel Brownlow, and Lamarque.

It is scarcely too late to plant Roses, in fact, I much refer doing it during the latter part of February to the months of December and January. Lift the plants carefully, and plant immediately, giving them a little water overhead if drying winds set in during the first month after planting. Look over beds, and replace any defunct plants while there is still time to do so with a fair prospect of success. Cuttings of Roses, and also those of such stocks as Manetti, De la Grifferaie, and Briar, that were made last autumn, had better be looked over at once, and pressed down where raised by frost. After so much wet, it would be better not to attempt treading them up firmly until we have the soil a little dryer. As soon as this occurs, loosen the soil slightly with a Canterbury hoe, drawing it towards the cuttings, and then making it firm around them. I may here remark that similar treatment will be very beneficial to Currant and Gooseberry cuttings, also to any plants propagated in the same manner.

Now, a word about pruning. Do not commence before the end of March, however sheltered your position may be. The end of February is frequently spoken of as a suitable time for pruning the hybrid perpetuals and Bourbons in warm localities, but I am quite certain it would be better to delay the operation for a few weeks, and I will treat upon it fully in due course. *A. P.*

ADIANTUM CUNEATUM FOR CUTTING.

From now onwards for the next three months the supply of this cut Fern is not, on the whole, so good as at other seasons of the year. Last year's growth will, if there had been any great demand for it, be pretty well used up; at any rate, the best of it will by this time have disappeared. There is in the case of most of us a tendency to keep picking the best fronds in an indiscriminate manner for our supplies. I am disposed, however, to think that it would be a better plan to set aside a dozen plants or so at the time, and let these be the stock for present use, rather than pick fronds in a haphazard way. When a batch of plants has in this way been cleared off of all that is serviceable, they should be given a little rest, being kept drier at the root in a cool-house. For instance, if any plants had been treated in this manner in the autumn, they would now make a reliable lot of plants to start into growth in a warm house, where they could be kept near the glass, with all the light possible. This matter of light is an all-important factor, in order to secure as hardy a growth as possible. The warmth of a stove is not quite the thing even at this season; whilst later in the spring and in the summer, it is totally unfit, the humidity being far in excess of what is required, resulting in fronds of large size, with the pinnæ corresponding, it is quite possible, but this is not the kind of growth that can be relied upon to stand well when cut. If now placed in a stove, a shelf is most decidedly the best place, so that the plants get all the light possible, with no risk of moisture in excess, such as would arise from the frequent use of the syringe in the usual course of procedure with stove plants. Another, and a good place for these early plants, would be such a position as one selects for Strawberries when they are swelling-off their fruit; or again, a heated pit upon an ash bottom would suit them well. In any case the plants should not be overcrowded, whilst if they have still some of their old fronds upon them, these may very well be all cut off. If the plants stand in need of a shift, let it be done at once, using sandy loam in preference to peat in every possible case; a large shift is not in any sense desirable, in fact I have often noted that the best results have been with plants quite potbound. The soil should be made firm in the pots, allowing in potting sufficient depth to lightly cover the old crowns. If so be the loam is not quite the thing, being perhaps of inferior quality or too nearly approaching clay, some finely broken up lime-rubble would be a good addition to it. When the old stools have been kept dry for some time, they should be soaked in tepid water before they are repotted; this will save after-watering to a considerable extent which is most desirable until root action is again active. Rather than repot where not absolutely needed, I would prefer to depend upon after-feeding, for which, nothing is better than weak guano-water made from the best "Peruvian." Whilst on the subject of potting, I might add that I am not an advocate for increasing this Maidenhair by division. I know full well that it may thus be successfully propagated, but I consider offsets do not equal seedling plants. These latter are extremely useful in many ways whilst still in quite small pots, making very compact and pretty plants which those that have been broken up do not always do.

Another good plan of growing this Maidenhair is by planting it out. This may be done either upon a flat surface or against a wall. There is many a place that may thus be utilised in a profitable way. I dare say many growers besides myself have noticed how well it will thrive where chance seedlings have come up, and that too, with but little soil wherein to grow. On the flat there are many narrow ledges which might thus be turned to a good account; such positions do not require much preparation. A single row of small plants turned out in good soil early in the spring, would have every chance of making fine stuff by the summer. Great depth of soil is not at all essential, but rather to be avoided. I have no doubt some of our observant cultivators with this hint will be able to turn it to a good account. I have in one place particularly seen A. cuneatum thus grown in an extensive manner. This was at Bodorgan, the plants being full of fronds, which for cutting would be of the utmost service. This plan may be adopted in houses of varying temperatures with every prospect of success, bearing in mind what has previously been said as to light and moisture. Another method, also an excellent one, is that of growing them upon walls. To lay the foundation for this system, a wire trellis fixed at about 3 or 4 inches from the wall is desirable. Behind this the soil, &c., can be built up a piece at the time if necessary. In such a case I would use a little peat with the loam, both being of a fibrous character. With this, if available, some bits of sandstone of divers sizes might be added for the special purpose of conserving moisture, which in itself is all important against a wall. To facilitate watering, a few holes could be left here and there, and where the soil was at any time found to be too dry, some holes could be made in a downward fashion so as to hold the water. At Penrhyn there is a fine example of this mode of covering a wall. In many other places it might be advantageously adopted, more particularly where from one cause or another the wall is an unsightly object. These wall-grown plants will supply fronds of an enduring character for cutting, and no better time than the early spring could be chosen for doing the work. *H.*

Orchid Notes and Gleanings.

SELENIPEDIUM (HYBRIDUM) SEDENI, var. WEIDLICHIANUM.

S. Schlimii and S. longifolium, with its varieties, have given rise to a rather numerous group of hybrids of a very ornamental character. The original form was the well-known S. Sedeni ×, which was obtained by crossing the typical forms of these two species together. The cross was made both ways, and, singularly enough, no difference could be detected in the offspring, whichever species was made the seed-parent. The varieties porphyreum candidulum, and leucorhodum were obtained by utilising other varieties of these species as parents. Thus, porphyreum came from Schlimii and S. longifolium var. Roezlii. The variety Weidlichianum, mentioned in the *Gardeners' Chronicle*, 1890, pt. 2, p. 702, originated from Schlimii and longifolium var. Hartwegi. It was raised in the collection of Norman Cookson, Esq., of Oakwood, Wylam-on-Tyne, and has been acquired by Messrs. F. Sander & Co. (Condensed from *Reichenbachia*, t. 51.)

Dendrobium Wardianum var. gigantea.

A flower of this variety has been submitted to us which measured 4 inches across, though it was less richly coloured than other forms. The plant which was imported by Dr. Gorton had two growths, and an aggregate of fifty-five flowers. It was grown by Mr. Reynolds of Gunnersbury Park Gardens.

Oncidium Jonesianum.

The fine importation of this charming Orchid, offered for Messrs. F. Sander & Co., of St. Albans, by Messrs. Protheroe & Morris, at their Rooms in Cheapside on Friday, February 24, was well received, and the plants are now widely distributed. So many failed to succeed with the cultivation of the plants of the former importation, that it would be well if those who did succeed with it would afford our readers some hints as to its management. So far as we have been able to glean, it will not thrive in a cool-house, but is best suited in a warm one; and, further, that it grows better on rafts or blocks, suspended, with the points of its stout terete leaves hanging downward.

Cattleya Trianæ—"Fairy."

This is a very beautiful variety of the C. T. delicata section, cultivated in the gardens of J. T. Holmes, Esq., Beechen Cliff, Bath. The flowers are white, suffused over their entire surface with pale rose, and exhibiting no other colour than a faint yellow tinge in the throat. Its petals and labellum are beautifully crimped, and altogether it is a flower which the florist will appreciate. *J. O'B.*

Dendrobium Hillii.

I herewith send for your inspection a photograph of this species of Dendrobium, which is now seldom seen in good condition. This plant formed part of the well-grown collection of Orchids belonging to James McKelvie, Esq., Edinburgh, and carried twenty-two racemes of flowers from twelve pseudo-bulbs, the former being from 12 to 16 inches long. It has flowered every second year, and is grown in a temperature of 50° to 60°, and was, as Mr. Findlay, the gardener, informed me, quite a small plant when he received it. *A. O.* [We should have reproduced the illustration had we not previously figured the plant. Ed.]

CHICAGO.

Primulas at the Exhibition.—Work at the Exposition grounds has been retarded by the severe winter, so far as outside matters are concerned; and, although the contents of the horticultural building did not suffer in the slightest degree, a good deal of anxiety was felt during January. The greatest degree of cold registered in Chicago was 22° below zero, while 10° to 18° below was noted on several occasions. Accompanied by penetrating lake-winds, this was a severe test of the heating apparatus in the large building, but a high temperature was maintained throughout, though at first there was some difficulty in distributing the heat properly. In addition to the severe cold we have had a good deal of snow, which, on this low swampy land is likely to retard gardening work in the spring. Successive thaws, followed by hard frost, have given the Exposition grounds a uniform covering of ice, making it both difficult and dangerous to get about, and the same conditions prevail all over the city. All the sewers are frozen, most of the catch-basins being choked with ice, so during our last two day's thaw there was much inconvenience, if not danger, from flooding. However, a cold wave suddenly reached us, changing the streets from Venetian canals to skating-rinks, and to-day (February 16) we are again suffering from severe cold and heavy snow.

The greatest attraction of the winter has been the display of Chinese Primroses; without question the finest display ever seen in America. It was a competitive exhibit, the seed being furnished by leading firms of Europe and America. It was all sown at the same time (April 21), and kept under uniform cultural conditions. Without question, the highest credit belongs to the English firms competing, such as Bull, Cannell, Carter, Kelway, and Laing, all of whom showed excellent strains. Cannell's whites were very fine. Carter was prominent in the blue or lavender forms. Princess Mary and the Queen both attracted great admiration; the last-named sort seems to retain the beauty of its foliage better than any other. Some excellent mauve sorts were noted among the plants exhibited by Vilmorin, Andrieux, & Cie. The German growers, Deppe Bros., Haage & Schmidt, and Ernst Benary, showed strains more remarkable for oddity of form and colour than for actual beauty. A most remarkable display was made by Hillebrand & Bredemeyer, of Pallanza, Italy, whose exhibit showed foliage of unusual beauty. The margins of the leaves were as crisply undulating as in closely-curled Parsley, some a rich bronzy-red, others a tender green. The flowers were not remarkable, but the foliage created a marked impression, being entirely new to us.

These plants were judged in January by Mr. Pfister, gardener at the White House, Washington, D.C. His opinion must be confirmed by a jury, who will not meet until May or June. Of course, the plants will be long past by that time, so the jury must perforce accept the opinion of the single judge. There is little doubt that the system of awards will be unsatisfactory to many.

The next show will be of Cyclamens, which are now coming into bloom. *E. L. T., Chicago, U.S.A.*

APPLE ATALANTA.

The above is the name of a new variety raised by Mr. Ross, gardener at Welford Park, and which obtained a First-class Certificate at the meeting of the Royal Horticultural Society on February 14, this year, when shown by Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, who will distribute the stock of it. The fruit is "small," longer than broad, 2½ inches wide, and 2¼ high, slightly ribbed, globose, conical, base deeply concave, apex truncate-depressed, surrounded by fine obscure slightly unequal lobes, eye closed, calyx-segments bent inwards. The skin is smooth, lemon-yellow, with a few scattered small red streaks and spots on one side. Stalk slender, ½ an inch long. The variety is fit either for culinary or dessert uses, and is in season from November to January.

Fig. 42.—Apple Atalanta.

FORESTRY.

THE ASH.

This genus comprises a great many species and varieties, some of which are first-class timber trees, while others are used principally for ornamental purposes. One of the best species for planting as a standard tree for embellishment is the flowering Ash (Fraxinus Ornus), a native of Italy; and although it has been grown in Great Britain and Ireland for many years, and has proved to be quite hardy, yet it is by no means used by planters to the extent which its merits deserve. Young trees planted on congenial soil and situation often commence to produce flowers by the time they attain the height of some 6 or 8 feet, so that the planter has not long to wait until he begins to see the fruits of his labour crowned with success. When fully established, its contour is that of a round-headed specimen, well furnished with branches and twigs in a regular and uniform manner all round, and densely clothed with foliage, which has a strong resemblance to that of the common Ash (F. excelsior), and when intermixed with its flowers in early summer it is highly attractive and inviting. It thrives best on a deep loamy soil, thoroughly drained, well broken up, and mixed with a small portion of organic matter. Stiff, retentive clay soil is inimical to its best form of development.

F. lentiscifolia is another interesting ornamental species indigenous to Asia Minor, and, although like the former species, it has proved to be quite hardy in this country, yet it seems never to have been planted to any great extent. It is generally propagated here by grafting, using the common Ash for the stock, but as the scion grows quicker, and attains a much larger circumference in a given space of time than the stock where the union takes place, it imparts to the tree rather an odd appearance. The following measurements will illustrate this:—No. 1, circumference of the base of the tree where the union takes place, 3 feet 3 inches; circumference of stock below the graft, 2 feet 3 inches. No. 2, circumference of tree at the base, 2 feet 8 inches; circumference of stock, 1 foot 10 inches; so that the trees actually appear as if placed upon the top of posts or pegs, which, no doubt, is an eyesore. The height of the stock where the union takes place is about 12 inches from the ground, so that it can be seen quite distinctly. Again, the bark on the stock has a smooth, clean surface, while the bark on the stem of the tree exhibits a rough, corky, furrowed appearance, all of which show variety and contrast. Notwithstanding all this, when the tree is fully established, it certainly makes a grand specimen for the park or lawn; the head is generally of a round or globular shape, pliant, and slightly pendent, and as it is well furnished with foliage of a light green colour, it has nothing of a hard or harsh outline in its appearance. It is also well adapted for planting in smoky districts about large towns, where the air is polluted with noxious vapours; and my remarks regarding soil for the former species may likewise be applied here with advantage.

The Monster Ash (F. monstrosa) is a strong, robust-growing tree, whose outline and general appearance is not unlike that of the common species, with this exception, that the terminal points of the branches and twigs are of a flat fascicular shape, like a cock's-comb, which gives the tree a very odd and strange appearance. It is not a very common tree to be met with, yet on account of its peculiar growth it is worthy of a place in the formation of ornamental plantations, to show contrast and variety.

The Parsley-leaved Ash (F. crispa) is a small upright-growing tree, which produces its Parsley-like small leaves in tufts or small bundles at the terminal points of the twigs and branches, and on which account it has rather a bare naked-like appearance. The leaves are of a dark-green colour, smooth and glossy, and turned down at the points, so that the tufts have a rounded compact cushion-like appearance. It has no particular merits as an ornamental tree, further than its peculiar habit of growth and rare appearance. *J. B. Webster.*

THE BULB GARDEN.

CROCUS SIEBERI.

This Crocus seems to be a rather scarce species. It is one of which one seldom hears, yet, in my opinion, there is not another which is equal to it. It has those qualities which, so far as I know of, no other Crocus has all of them. It is perfectly hardy, of easy culture, very early, and very beautiful. It has flowered with me in the open border, and is gone off, while the other Crocci are only just appearing.

During the sunny days we have lately had, a clump of it in the open, was unsurpassable. I can thoroughly recommend it to all lovers of flowers, as one of the best of outdoor winter flowers. It is figured in the *Botanical Magazine*, t. 6036, but the picture does not convey to one its full beauty. Mine were planted 3 or 4 inches deep in ordinary garden soil. *T. E. D., February* 27, 1893.

Forcing Narcissus poeticus ornatus.

The demand for white flowers is great in Birmingham, and notwithstanding the large supplies sent into the market, large quantities are grown in the neighbourhood. It occurred to Mr. John Pope, of the firm of Messrs. Pope & Sons, who has taken up Narcissus rather extensively, and possesses a fine collection, to try how N. ornatus would do with a little heat, and with this intent he lifted a few thousands of bulbs when dormant in August, and placed them closely together in boxes of garden mould, covering them a few inches. These were stacked out-of-doors until November, then removed to a cool house, some of them being put underneath the greenhouse stages, and early in January some were lifted on to the stages in a slightly-warmed house. Early in February he was enabled to cut large quantities of flowers, which fetched excellent prices in the market, and many were used by the firm for wreaths, crosses, &c. The supply is still kept up by putting in boxes in succession; but owing to the quantities of imported bloom, the prices obtainable are not so high. When all the blooms are removed from a box, the bulbs are still kept growing, but it is in a cooler house, and after some degree of hardening off they will be planted out in May, there to remain for a year's rest, when they are again ready for forcing, and will throw up from three to four blooms each, and even very small bulbs will carry blooms. Narcissus poeticus is not so accommodating under the same treatment, and takes longer to recoup its energies after forcing, so that N. p. ornatus is much more useful. *W. D.*

The Week's Work.

FRUITS UNDER GLASS.

By Jas. Whitton, *Gardener, Glamis Castle, Glamis, N.B.*

SUCCESSION-HOUSES will require daily attention by disbudding, pinching, and tying as found necessary. Those started at the beginning of the month of February are bursting their buds fast. Continue to syringe them until the shoots are an inch or two long, when the practice may be gradually discontinued. Increase the temperatures at night by 5°. At this season we frequently have cold keen winds with bright sunshine, and on days when such occur keep the houses somewhat closer and warmer, with a plentiful supply of moisture in the atmosphere, and ventilate them very carefully. Where it is intended to plant young Vines, and the soil is not prepared, see that such is done before the heavy pressure of regular spring work comes on. The borders may be made up just now, although it is not necessary to plant the Vines for some time yet. Much diversity of opinion exists regarding the proper method of making up Vine borders. I prefer the simplest as a saving in time and labour, believing equally satisfactory results are obtained, and that the borders last longer than they do with the elaborate mixing and turning method. Then I have the turf cut and carted to the border, which is made up somewhat in the same way as that usually adopted in stacking turf for potting purposes, putting a thin stratum of mixed charcoal, crushed bones, and lime-rubbish between each layer of turves. With heavy clay soils, add some fresh horse-droppings, more mortar-rubbish, and Thomson's manure. [It is sometimes advocated by good practitioners to make up Vine borders piecemeal, the first portion being made up about 5 feet wide. Ed.] Should a partial renewal of border be desired, and, from many causes, it cannot be done in the autumn, it can be successfully renewed in the spring, when the shoots are from 4 to 6 inches long. In all cases, see that the soil is in good order, particularly not too wet. In fact, use it more on the dry than the wet side.

STRAWBERRIES.—Remove the plants on which the fruits are beginning to colour to a drier and more airy atmosphere, and keep them well exposed to light. At the same time do not allow the atmosphere to get too dry, or the plants to suffer from want of water at the roots, as both conditions are inimical to fine quality. Bring on succession lots, each of which will require due attention to fertilisation of blooms, thinning, &c., as their state demands.

MELONS.—Continue to make succession sowings as may be found necessary. Where regular Melon-houses are at command, fill the beds with the soil, and when it is sufficiently heated, the plants may be set out when ready. Pot on the sowings made early in the month if sufficiently advanced. The earliest lot beginning to swell up their fruits had better be closely examined as to state of moisture at roots. They may, if requiring water, get some weak liquid manure, only stimulants at this season have to be applied with caution. Watch carefully for canker at the collar of the plant, and apply hot lime or powdered charcoal and sulphur to the part as soon as the disease is detected. Maintain a brisk growing temperature, and syringe early in afternoons to keep down red-spider. Those in bloom will require daily attention in fertilisation of female flowers.

CUCUMBERS.—Where the fruits are swelling fast, give supplies of weak liquid manure warmed to temperature of 75°. Cucumbers will stand a little more stimulating at this season than Melons, but care has also to be exercised. If the fruits are cut when ready, they will keep good for some time if placed in a cool room. The early removal of the fruits is beneficial to plants, and they will bear much longer and more satisfactorily when such procedure is regularly carried out. Continue to remove all superfluous fruits and shoots, by going over the plants once or twice a week, pinching and regulating as required. If plants are desired from cuttings—and some growers prefer these—they can now be easily struck where a close frame or large bell-glass is at command. Insert the cuttings singly in small pots, and when rooted, pot and grow on for later supplies. The materials for hotbeds had better be collected and prepared soon, especially if the crop is desired during June and July.

TOMATOS.—The early lot will, if all has gone well, be showing their first flowers. Keep a warm airy atmosphere, and stop syringing the plants, the necessary moisture being supplied by damping the paths, &c. Rub out all side-shoots, and keep the plants to the number of stems desired; we prefer the single stem system. With a buoyant warm atmosphere there is not much difficulty in getting a good set of Tomatos. Prick out seedlings, and pot on succession lots when ready.

FIGS.—Those in the cold-house must be put in order without delay. Do not overcrowd the shoots, and in pruning, only remove worn-out or badly-ripened shoots. Shut up the house according to the time when the crop is desired, allowing fully five months in which to grow and begin to mature the fruits.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

ERICA HYEMALIS AND E. WILMOREANA.—Plants which have finished blooming should be cut well back, and encouraged to make fresh growths, and after a good start is made they should be potted into fibrous peat and silver sand. Specimen Ericas need much attention in the matter of watering, and on no account should they get dry at the roots, or the foliage will fall off. Any small plants requiring repotting should get attention, using the best hardwood peat and clean sharp sand. Afford an abundance of air during mild weather, keeping a sharp outlook for mildew, and if it be seen, dusting the plants with flowers of sulphur at once.

NEW HOLLAND PLANTS, such as Boronias, Chorozemas, Dracophyllum gracilis, Leschenaultias, Pimelias, Aphelexis, &c., must be carefully attended to in the watering and only rain water, if obtainable, or pond water should be used. In training these plants, avoid pushing a great number of sticks down into the mass of roots, which are much injured thereby. All hardwooded plants should be kept as near the glass as possible, and be well ventilated at all suitable times. The present is a good time to pot any of the specimens that require it, and most of the New Holland plants having hardy wood do well in good hard fibrous peat, not finely sifted, but fairly rough; and silver sand. The drainage must be good and the pots clean. Pimelias like a small quantity of light turfy loam mixed with the peat. One of the most useful hardwooded plants for cutting from at any time or for decorative purposes during the spring is Diosma ericoides, with its abundance of small and green grassy-foliage, deliciously scented. It is in some places in great demand as greenery in bouquets, and for mixing with cut flowers. It strikes easily under a bell-glass in a cool-house from cuttings taken from the points of the growing shoots. The proper time for taking cuttings is spring or early summer; it is a useful plant when grown in 6-inch pots for house-work, and also makes a fine specimen when potted on. The plant likes good peat and turfy loam, with plenty of sand.

CHOISYA TERNATA will strike from cuttings at this season under a bell-glass on mild bottom-heat. It has sweet Hawthorn-like flowers, is a favourite plant for the conservatory or forfilling vases, and is an easily grown plant; loam and peat, and a little leaf-mould with plenty of rough sand, suit it.

CHRYSANTHEMUMS.—The early-struck cuttings of these should be potted as soon as they are ready, using 3-inch pots for them, sifted loam, leaf-mould, and sea-sand. They will do very well in cold frames if frost be kept out, or on shelves in the greenhouse, affording shade for a time during bright sunshine. Do not stop the shoots when potting them. Continue to take cuttings of varieties hitherto not obtainable. Afford them plenty of water, not letting the cuttings flag for want of it.

FREESIAS.—Bulbs going out of flower should be placed in a temperature that will not stop growth, and be very gradually ripened off. Seeds of Freesias sown now in gentle heat will bloom next winter if good attention be paid them. Sow the seeds in 3 or 4-inch pots, and re-pot the seedlings till they come into 5 or 6-inch pots.

ROSES.—If greenfly infests these, and it is not convenient to fumigate them, there is nothing better for use than a quassia and soft-soap solution—that is, 4 oz. of quassia-chips, and 4 oz. of soft-soap, to 1 gallon of soft-water, set on the fire cold, and boiled for 10 minutes. After it starts to boil, strain off, and use when cold. It is also excellent for young Peach-shoots, which are often injured by fumigation. A good syringing with clean water the day after will take off the smell of soap-suds, if that is considered to be disagreeable.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

REMARKS ON CERTAIN SPECIES.— Plants of Calanthes vestita oculata, C. v. luteo-oculata, and C. Veitchii, Thunias Bensoniæ and T. Marshalliana should be put in a warmer place than they at present occupy, the time for potting being at hand; and I like them to be actually starting to grow before they are shaken out of the potting material. The removal of the latter requires care in the doing, and then the plants will take freely to the new materials, which has not time to become sour before the roots penetrate it. The various Orchid-houses should now be gay with plants in flower, such as Cattleya Trianæ, Cœlogyne cristata and its varieties, C. c. alba, C. Lemoniana, Cypripediums in variety, Odontoglossum crispum, O. Pescatorei, Phalænopsis amabilis, and P. Schilleriana. The temperatures which are advisable from the present time onward are, for Dendrobiums, 65° at night, 70° to 75° by day, rising 10° or thereabouts with sunshine; Cattleyas, 60° by night, and 65° by day; the Phalænopsis at 65° to 70° by night, and 75° by day; the house of the Odontoglossum crispum, 50° at night, and 55° by day; and the intermediate-house at 55° by night, and 60° by day. Possessing a collection of Dendrobiums, it is an easy matter to have plants in bloom from New Years' Day till the end of the month of May, if the right kind of treatment is adopted. Dendrobes should be grown as for forcing, like some other species of plants, and by making use of the naturally early flowerers year by year, they can be got to flower more freely than those not accustomed to it, just as in the same way that an Azalea indica forced regularly will flower sooner than another not so treated. And blooming early they also make growth early. I make a point of having D. nobile, D. crassinode, D. Wardianum, and D. heterocarpum in flower early

in the year, but the general stock of our plants is not started until the middle of the month of February, when we close the house for a few weeks before heat is turned into the hot-water pipes, and the warmth of the house after it is started does not fall below 55° at night, this being increased as the days lengthen, but using as little fire-heat as possible; in fact, in sunny weather, it is usual to turn it off in the daytime. By adopting this plan, the flowers and growths are strong at the beginning of the season, and strong new growths seldom look back after starting. After the flowering is over, any plants which may require potting or top-dressing are seen to without delay, and encouraged in every practicable way to make growth quickly. All the species of Dendrobiums are improved by having fresh sweet compost about their roots, which may consist of equal parts of good fibrous peat, with most of the earthy particles shaken out of it, and freshly gathered sphagnum moss, with a large addition of clean crocks and charcoal broken moderately small. It is a good test of the compost being unsoured if the sphagnum moss is growing nicely; dead or dying moss indicates a soured condition. Dendrobes when growing freely take large quantities of water at the roots, and require to be syringed overhead daily. Syringing is a help towards keeping down insect enemies, some of which are very injurious to the tender, young growths. The worst one that has to be contended with is a yellow fly; and sometimes thrips appear; but during the present month we try our utmost to check the increase of the latter, and that which I find to answer better than fumigating with tobacco, &c., is Williams' Thanatophore, which does no harm to the flowers of Orchids. I do not recommend the pruning of Dendrobiums, as they may be well grown without it; but if flowers are required for cutting, it will do the plants no harm to cut off the pseudobulbs with the flowers on them, when the latter will last a long time. Only a few Dendrobes may be cut in this way. I would not prune in this manner a rare garden hybrid possessing, say, only half-a-dozen pseudobulbs, for it might mean the death of the plant.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

PENTSTEMONS.—Amongst popular hardy plants few surpass Pentstemons for general usefulness, beauty of bloom, and grace of habit, and they are equally adapted for planting in the mixed border or rock garden, as in beds by themselves. The flowering season begins in June, and continues till after the appearance of frost in the autumn. Pentstemons may be readily propagated from seeds and cuttings; the latter method being that usually adopted for species and named garden varieties; but some species do not produce shoots fit for cuttings very freely, and seeds, if possible, should be saved for increase. Seed may now be sown in gentle heat in pans or shallow boxes of light, friable soil; and when the seedlings are large enough, so that they can be handled conveniently, they should be potted off singly, and kept in a gentle heat till established, then gradually hardened off, and about the end of the month of May planted out-of-doors in prepared soil. With good culture many of these will flower the same year, in the autumn. Plants raised from seeds sown in the open ground in June, potted in August and September, preserving them in a cold frame during the winter, flower early the next year out-of-doors. Cuttings will form roots at almost any time of the year when they are procurable, but the best time is September, when sideshoots can be had in abundance. Where the desire is to procure a large number of cuttings of any particular variety or varieties, these may now be obtained by potting up some of the old plants, and placing them in a gentle heat. Cuttings should be inserted in pots (48's) of light sandy soil, and placed in a slight bottom-heat, and soon as rooted, they should be potted, and kept till the end of May in a frame. Pentstemons are comparatively speaking hardy plants, still they are apt to succumb in our winters; and moisture being probably more injurious to them than frost, it is important that the drainage be good, especially for the choicer species and varieties. [Some species, as P. gentianoides and P. alba, live for many years under a winter covering of Oak or Beech leaves. Ed.]. As a soil, sandy loam, with plenty of decayed manure, suits the plants, and their stations in borders or beds should have these ingredients mixed with the staple. In dry weather, water them copiously. The following are some of the best species for garden decoration:—azureum attenuatum, coccinea, Jaffrayanus, barbatus and its variety, Torreyi; campanulatum, glabrum, Cyananthus, Hartwegii, heterophyllum, Murrayanun, Wrightii, spectabilis. The numerous garden varieties are principally the offspring of P. Hartwegii and P. Cobeæ.

HARDY BEDDING PLANTS. — Where Violas, Stachys lanata, Cerastium tomentosum, Antennaria tomentosa, Sedum acre and its varieties, and many others too numerous to be named here, are used in the summer bedding arrangements, and can be planted in the unoccupied beds, the present is a good time to commence the work; but where the places these plants will occupy in the summer are still filled with the spring-flowering subjects, the clumps may be divided into small pieces, and planted in the reserve, where they will make serviceable plants for the coming summer. Edgings of these plants should on no account remain longer than two years without replanting.

EULALIA JAPONICA AND ITS VAR. ZEBRINA.—This ornamental hardy grass, so useful in subtropical bedding, should now be divided, potted in rich soil, and kept close for a time. It will, served in this manner, make useful subjects by the time they will be required.

CARNATIONS AND PINKS which have been wintered in frames, should now be planted outside if the ground is in good order. Previous to so doing, the lights should be taken off them for a few days and nights, for, however hardy plants may be, if they have been under glass, they should be well inured to the air before being turned outside.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

ONIONS.—If the ground on which this crop is to be grown has been dug as previously advised, it should now have a dressing of some kind of artificial manure, and when dry enough to tread upon, it should be forked over, taking care to break all lumps so as to render the tilth as fine as possible. For this work it is well to take advantage of fine days, so that after being forked over and it has got sufficiently dry, it may be raked smooth, and the seed sown. Before the soil is raked, it should be well trodden, so as to make the surface firm; as if the soil be loose on the surface, there is always a tendency to form thick-necked bulbs. Drills should be drawn from 1 foot to 1¼ foot apart, according to the size of the variety grown, and the condition of the ground; and these should only be sufficiently deep to allow the seed to be just covered with the soil. If the seed be buried deeply, the base of the bulb has not such a good chance of being above the soil. Firm, medium-sized, well-matured bulbs keep best, so that it should be the cultivator's aim to produce such, unless he intends to exhibit, then extra pains may be needed.

BROAD BEANS.—Another sowing of these should now be made, and the Green Windsor is the most suitable variety to sow at present [but it is not the most prolific. Ed.]. Where the ground is in good heart, plenty of space should be allowed between the rows and the seeds in the same.

CELERY.—The main crop of this may now be sown on a bed of light soil on a slight hotbed, scattering the seed thinly and evenly over the surface, which should be first made level and smooth, a small quantity of fine soil being sifted over it. If the soil be but slightly dry, afford a gentle watering when the sowing is made, but unless this is the case, no water should be afforded till the seed germinates. The frame may be covered for a few days to exclude the light and prevent evaporation, but the covering should be removed before the plants germinate. Celery, earlier sown, if large enough, may be pricked off, not allowing it to receive a check in any way, which often is a cause of bolting.

SEAKALE.—Where sets are not yet planted, no time should be lost in getting them into the soil; for although top-growth will not begin at once, new roots will be forming, and the sets will grow vigorously when warm weather does come. Do not use sets made from plants that have been forced, as these are too much exhausted. Those crowns in the open ground should now be earthed up for late supplies of shoots. It is not advisable to lift any so late in the season as this, the shoots being somewhat stringy from late forced Seakale. If a very late supply is needed, it is a good plan to grow a few rows on the north side of a wall, where naturally growth will be much retarded.

JERUSALEM ARTICHOKES should now be planted The ground best suited to the growth of these is a light sandy one, and they should be planted in rows, 2 feet apart, and 18 inches between the roots. Heavy soil produces much top-growth and small tubers.

SMALL SEEDS.—Make in a dry state of the soil sowings of Radishes, Turnips, Spinach, and Lettuces. If not already done, sow the early forcing or other quick-growing kind of Carrot in the open ground on warm borders. A small sowing of Snow's Winter White and Sutton's Winter Mammoth Broccolis may now be sown in the open, also Veitch's Autumn Giant Cauliflower. Where early Savoys are required, a sowing of the Early Ulm or other early variety may now be made. Protect all such seeds from birds.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

DELAYED OPERATIONS.—During February there is in most gardens, weather permitting, more work done in the hardy fruit garden than in any other month in the year. Rain, however, having fallen on twenty days, prevented much of the work being accomplished, the more necessity therefore to push on all matters that are in arrears, especially the pruning and training of Peaches and Nectarine trees, if such there be. Whilst admitting the truth of the dictum that autumn and early winter pruning is the best for Apples, Pears, Plums, &c., yet, where such was not carried out, it may still be performed without injuring the trees. In the case of young and vigorous specimens of Apple and Pear trees, I have obtained fruit from varieties which, by spring pruning, have been induced to bear on the previous season's growth. With the bloom-buds so prominent as at this date, any young shoots thickly set with buds may be left entire, its removal being effected next season. Notes should be made of this peculiarity in Apples, these varieties being very suitable for orchard planting. That coming variety, Bismarck, possesses this peculiarity, as also does Cox's Orange Pippin, and many others.

THE MORELLO CHERRY.—Grown as a rule on north walls, and invariably left till late in the pruning season, these trees should now be pruned, and afterwards trained. It is a common mistake to leave the young shoots much crowded together, thus providing hiding-places for the ruinous black aphis, which usually give the gardener much trouble to dislodge them. In pruning, remove as many of the unfruitful naked branches as may be done conveniently, spreading out the young shoots that are left at the summer pruning somewhat thinly, the aim being to have the trees furnished in every part, but not thickly crowded. The distance apart of these small shoots should average 3 inches. When the pruning is finished, thoroughly wash the trees with soap-suds twice or thrice.

DRESSING TREES SUBJECT TO APHIS.—Assuming that all the Plum and sweet Cherry trees are pruned and tied, they should, now that the buds are on the move, be dressed with soap-suds, to thirty gallons of which half-a-pint of petroleum should be added, and the two well mixed together. With this mixture every part of a tree must be well wetted, taking care to direct it behind the branches as well as in front.

GENERAL HINTS.—Stakes of all kinds, if made at this season whilst green, and stored in the dry, will last at least one season longer than green stakes. Ground intended to be planted with Strawberries early next autumn, if prepared at this season, by trenching and liberally manuring, may be used for any kind of kitchen garden crop, which can be cleared off in time for Strawberry planting in July, or early in August. This is better practice than planting the latter on newly-dug land.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to return unused communications, or illustrations, unless by special arrangement.*

ILLUSTRATIONS.—*Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but, the Editor cannot be responsible for loss or injury.*

NEWSPAPERS.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY,	MAR. 14	Royal Horticultural Society's Committees. National Rose Society. Horticultural Club.
THURSDAY	MAR. 16	Linnean Society.

SHOWS.

TUESDAY,	MAR. 14	Royal Horticultural Society, at the Drill Hall, James Street, Westminster. Manchester Royal Botanic Society's first Spring Show.

SALES.

MONDAY,	MAR. 13	Roses, Lilies, Begonias, &c., at Protheroe & Morris' Rooms.
TUESDAY,	MAR. 14	Japanese and other Lilies, Picotees, Iris, Gladioli, &c., at Protheroe & Morris' Rooms. Orchids from Upper Burmah, also Odontoglossum Alexandræ, at Protheroe & Morris' Rooms.
WEDNESDAY,	MAR. 15	5000 Japanese Lilies, Roses, Tree Ferns, Gloxinias, &c., at Protheroe & Morris' Rooms. Sale of the Fernside Collection of Established Orchids, at Protheroe & Morris' Rooms.
THURSDAY,	MAR. 16	Home-grown Lilies, Stove and Greenhouse Plants, Chinese Sacred Lilies, &c., at Protheroe & Morris' Rooms.
FRIDAY,	MAR. 17	Orchids, from Messrs. Linden, Brussels, at Protheroe & Morris' Rooms. Special Sale of Carnations, Picotees, Cannas, Pinks, &c., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—42°.7.

Garden Teaching.

THE appointment, under the auspices of several County Councils, of competent lecturers and demonstrators of practical gardening in various rural districts, is a measure that has always commanded our sympathy and elicited our advocacy. Knowing what has been done in Belgium and other continental countries for years past, we were not without substantial grounds for the course we have taken; and the results that have accrued up to this time in our own country do but confirm us in the belief that this movement is calculated to be of very great service to the inhabitants of rural districts, and to the country at large. Books for the instruction of cottage and allotment gardeners have not been wanting, and they have met with a certain measure of success. Very many thousands of *Paxton's Calendar*, for instance, have been sold, and the annual demand continues to be large. Still, it must not be overlooked that a book does not, and cannot, appeal to the class we are considering as the spoken word does. Many people of the class we are alluding to cannot read a book of any sort with profit to themselves. They are not accustomed to reading, their attention is not secured; they fail to appreciate what is put before them in print. They require, in fact, to be trained to read before they can derive benefit from a book. This is so, to a certain extent, even with the more highly-educated classes. Put a book before them on a subject with which they are not previously familiar, and a special effort of attention is requisite to enable them to read it with any advantage.

Again, amongst the labouring classes, there is very often a prejudice against "book-learning." It is, of course, true that many a man may be an excellent cultivator without ever looking at a book. It is equally true that no amount of book-learning by itself will ever make a good practitioner. It is the appreciation of the value of the information given in books, and its application to practice, which the lecturer can insist on. He can prepare the way for the profitable use of books—he can show how they can be used and why they should be studied—and in that way he can secure to his audience a broader, deeper, more intelligent knowledge of the subject than mere routine practice will ever give them. We have been reminded of this by what we must style a very original book, a copy of which has just reached us. The *Primer of Horticulture** has been written by Mr. JOHN WRIGHT, "horticultural instructor," a gentleman eminently fitted for his task from his long practical experience in the garden and at the editor's desk. The book purports to be the sum and substance of certain lectures "on practical gardening on a sound basis," which were delivered in various parts of Surrey under the auspices of the County Council. That the purely technical teaching should be excellent of its kind, is only what might have been expected from the known attainments of the lecturer. We do not find, we did not expect or desire to find, novelty in the treatment of so well-worn a subject. Where, then, does the "originality" with which we credited the book come in? The reply is, that this quality is very apparent in the questions and answers appended to the summary of each lecture. It should be premised that the substance of the lectures includes the consideration of such subjects as allotment-gardens, high cultivation, the nature and treatment of the soil, the raising of crops, the food of crops, manures, the common pests of the fruit garden and vegetable quarter, the growth of the several descriptions of garden crops, their utilisation and disposal, and similar cognate subjects. These matters are all treated with that clearness and directness that come of long experience, and thus, from that point of view, the book cannot fail to be of very great service.

The purpose of the book is to supply practical instruction, and that is so well carried out, that we shall not complain if we do not find the life-history of plants dealt with in the same manner as they would be in a physiological text-book. Nevertheless, it is as well not to put before the student that which he may find it requisite to unlearn at a future time. For instance, what would an examiner say if he received from a candidate such a statement as this:—"The production of roots from cuttings is formed by the sinking of the sap, this collecting at the base, and forming a lip or cushion known as a callus, from which roots protrude." This is theory indeed, but it is one to which the facts of the case give as little countenance as they do to another statement that "young Crab trees are changed into Apples by budding." It would be better in such a case to stick to facts, and to leave their explanation alone. Whilst, as we have said, the practical directions are excellent illustrations of sound teaching, the questions and answers are very suggestive and very interesting, as showing what was passing in the minds of the auditory; and so we find interpolated between questions relating to manuring and so forth, enquiries and replies which go to the root of the question of land-tenure, the fair proportion of profits that should go to the landlord and to the tenant, and the reciprocal duties of each to the other. These be cardinal points, no doubt, but we do not advise horticultural instructors to discuss questions of political or social economy, however important, on such occasions, being fearful that their influence for good may be neutralised by the introduction of such controversial subjects. Indeed, we are glad to see that the author is alive to this danger, saying, "It is not, however, within my province to answer questions of a controversial nature connected with the acquirement and value of land, and I ask that they be limited to points of cultivation and management," and so for the most part they were. The questions put as to practical matters are remarkable as showing the grip the questioner really had of his subject, and they will be specially valuable as furnishing hints to other lecturers under like circumstances. They show what are the special points upon which the auditory requires information; they show where it is necessary to give clearer or more detailed explanations, and altogether we should say that they were as valuable to the lecturer himself as the answers he gave were to those who framed the questions. We look on the publication of the book as a most hopeful sign of the progress of the scheme, and we believe that its circulation will be adequate to its intrinsic merits.

* MACMILLAN & Co., price 1*s*.

DAFFODILS IN GRASS.—Our illustration (fig. 43) is taken from the grounds of Mr. W. B. HARTLAND, of Ard Cairn, Cork, close to the sea, and shows beds of various Daffodils now in bloom, such as bicolor, Horsfieldi in the foreground, with Countess of Annesley, Empress, Colleen Bawn, Sir Watkin, and others. Whilst Daffodils compete with the Grass, Ivy, and Misleto, rooks avail themselves of the trees, the whole forming a delightful picture. In green-drives by the side of woodland walks in "wild-gardens," nothing can be more charming than to see the Daffodils and other flowers "spearing" at their own sweet will through the grass; but on lawns, in the vicinity of architectural features and in the garden generally, it is best to grow them in beds. Of course, for nursery purposes, this is essential.

LINNEAN SOCIETY.—At the meeting held on Thursday, March 2, Professor STEWART, President, in the chair, Messrs. W. RIDEWOOD, L. OUGH, K. R. KIRTIKUR, and Rev. J. LAMONT, were elected Fellows. Mr. J. M. MACOUN gave an account of the Flora of the Behring's Sea Islands, from personal exploration. On behalf of Mr. H. N. RIDLEY, the Secretary read a paper on the "Flora of the Eastern Coast of the Malay Archipelago." The meeting then adjourned to March 16. On the occasion of the evening meeting, to be held on that date, at 8 P.M., the following papers will be read:—1, "Botanical Results of the Sierra Leone Boundary Commission," by G. F. SCOTT ELLIOT, F.L.P.; 2, "Contributions to the Arthropod Fauna of the West Indies," by R. J. POCOCK.

ROYAL HORTICULTURAL SOCIETY.—The next display of fruits, flowers, and vegetables, in the Drill Hall, James Street, Victoria Street, Westminster, will be held on Tuesday, March 14, at 3 P.M. Professor HENSLOW will lecture on "Some

Effects of Growing Plants under Glass of various Colours;" a subject which ought to be interesting to gardeners. At the Scientific Committee the subject for discussion is Prof. F. W. Oliver's second Report on the effects of urban fog on cultivated plants.

Horticultural Club.—The usual monthly dinner and *conversazione* will take place on Tuesday, March 14, at 6 p.m. The discussion will be on "Imported Fruit as affecting British Fruit-growing," to be opened by Mr. James Webber and Mr. Geo. Monro of Covent Garden. The Committee meets at 5 p.m., for the appointment of Trustee and the balloting for Members.

The Manchester Botanic Gardens.—Writing to the *Manchester Guardian* on February 18, *apropos* of horticultural education at the Botanical Gardens, a correspondent observes: "I was present at the meeting held yesterday, of which a short account appears in your issue of this day. The address of Professor Weiss was most interesting and instructive, and it seems to me that our Botanical Gardens were never put to a better purpose than becoming a centre for diffusing in this way botanical and horticultural instruction. The advantages held out to gardeners are very great indeed, and I would urge upon all who have gardeners to allow them an hour away from their duties in order that they may gain information which can be brought to bear upon their every-day work; besides which, the amateur who has a small patch of garden, and perhaps a greenhouse, will gain information that will be of great service to this class of the community.

The Rothamsted Jubilee.—As we announced in our last issue, the Prince of Wales presided on March 1 over a meeting convened by the Duke of Westminster, for the purpose of considering the best means of commemorating the completion of the first half-century of the agricultural experiments which have been continuously carried on at Rothamsted by Sir John Lawes since the year 1843. "During the whole of this period," said His Royal Highness, "Dr. Gilbert has been associated with Sir John Lawes in the work of experimental research. As you will be aware, the Rothamsted experiments have from the commencement been entirely disconnected with any external organisation, and have been maintained at the sole cost of Sir John Lawes. For the continuance of the investigations after his death, Sir John has recently made the munificent endowment of £100,000, besides the famous laboratory and certain areas of land, and has nominated some of the most distinguished scientists of the day to administer the trust. In view of all these facts, and the great national importance of the Rothamsted experiments, it is only fitting that some public recognition should be made of the invaluable services rendered to agriculture by Sir John Lawes and his distinguished colleague, Dr. Gilbert." The Duke of Westminster proposed the following resolution: — "That, having regard to the great national importance of the series of experiments which have been carried on at Rothamsted during the last fifty years, it is desirable that some public recognition should be made of the invaluable services thus rendered to agriculture by Sir John Lawes, and also by Dr. Gilbert, who has been associated with the experiments during the whole period. That, with this object, subsciptions, to be limited to two guineas, be invited from all interested in agriculture, whether scientific or practical." Mr. W. T. Thiselton Dyer said he seconded the resolution which had been moved by the Duke of Westminster

Fig. 43.—Daffodils on turf at Ard Cairn, Cork. (see p. 296.)

—not as an agriculturist, but as one officially and all his life deeply interested in everything that was concerned with botanical science. The extraordinary merit of the work carried on at Rothamsted lay in the fact that these experiments had been continuously carried on under uniform conditions for so long a period. No other such scientific experiments made continuously were on record. They had shown what would be the ultimate effect of the cultivation of the world's surface without manures, and what would be the mean actual fertility of the land. The economic consequences of such a future when the valuable resources of artificial manures were more or less exhausted, was one of extreme importance. He should like to say something, too, about the magnificent work carried on at Rothamsted with regard to the nutrition of animals. The difficulty, the patience, and the trouble required for a scientific investigation of that kind were incalculable. He ventured to say, as a scientific man, that he knew nothing in the whole records of scientific research more honourable to this country than those experiments which were being carried on at Rothamsted with such self-denying skill. Sir John Evans moved:—"That, in the opinion of this meeting, the testimonial might advantageously take the form of (1) a granite memorial, with a suitable inscription, to be erected at the head of the field where the experiments have taken place; (2) addresses to Sir John Lawes and Dr. Gilbert, accompanied (if funds permit) by a commemorative piece of plate." This was also carried, and it was unanimously resolved that the following should be requested to act as a committee for carrying the resolutions into effect:—The presidents of the Royal, Royal Agricultural, Linnean, and Chemical Societies, the Earl of Clarendon, Viscount Emlyn, Sir John Lubbock, Sir John Evans (Hon. Treasurer), and Mr. Ernest Clarke (Hon. Secretary), with power to add to their number. The Duke of Westminster moved a vote of thanks to the chairman, and the Prince of Wales said, in response, that nothing had given him greater pleasure and satisfaction than to take the chair on that occasion, and to testify, as an agriculturist, his own sense of gratitude for what Sir John Lawes had done for agriculture. Subscriptions to the fund may be sent to any member of the committee, to Sir John Evans, F.R.S., at Nash Mills, Hemel Hempstead, or to Mr. Ernest Clarke, at 12, Hanover Square, W.

The Oxford Botanic Gardens.—The Oxford correspondent of the *Westminster Gazette* writes:—The state of the various buildings in the Botanic Garden is the subject of an elaborate report from the curators, who have called in Sir Joseph Hooker to advise them. Result—a sum of £3500 is required to put things straight, but the expenditure may be spread over several years. The garden is one of the most beautiful spots in Oxford, but, unfortunately, it is not taken very seriously, and the students of botany are few. The university, in the face of falling rents and a possible diminution of internal revenue, will soon have to consider seriously its attitude towards special studies.

Edinburgh Botanic Gardens.—In a class of upwards of 300 students at the Edinburgh University Botanical Examination, held by Professor Balfour, at the Botanic Garden, Mr. James Wm. Watt, eldest son of Mr. James Watt, Carlisle, obtained second honours for herbarium.

Stock-taking: February.—Farmers will always find the Board of Trade monthly returns of interest to them, and little need to await the issuing of the Annual Report with its staggering totals. In our first table, under § II. (A) and (B), will be found plenty of food for ruminating over, and the outcome must always be encouragement for the thorough-going agriculturist—he knows the wants of the people, it is for him to make the first profit—the nearer his condition approaches to that of his foreign or colonial competitor. Here the politician comes in, and we give an extract from the summary of imports into this country during the month of February:—

Imports.	1892.	1893.	Difference.
	£.	£.	£.
Total value for month	£34,877,931	£29,758,748	—5,119,183
§II.—(A.) Articles of food and drink—duty free	11,598,697	9,613,936	—1,984,761
(B.) — do., dutiable	2,092,645	1,810,412	—282,233
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	7,648,183	5,890,404	—1,757,779
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	2,488,456	2,099,446	—389,010
§IX. — Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,322,575	1,098,450	—224,125
(B.)—Parcel Post ...	57,325	43,643	—13,682

Of various products we are importing less than in the same month last year; in most things values are very low. Freights are nearly all in favour of the importer; some of the quotations seem ruinously low, and very like abolishing dividends from steamship companies. We note how the Australian dairy-farmers are looking after our butter-markets. One consignment paid freight amounting to £5600; any junior can work out the number of pounds at 1*d.* per pound freight. We have been told that the Colonial butter is of a very even quality; this cannot be said of that sent to market from many of our own farms. Some interesting figures are to be found in the following extract from the above-noted § II. respecting the imports of fruits and vegetables:—

Imports.	1892.	1893.	Difference.
Fruits, raw:—			
Apples ... ... bush.	345,855	246,728	—99,127
Cherries ... ... ,,	...	...	...
Plums ... ... ,,	...	...	...

It may be worth mentioning that we anticipated the agricultural return in the matter of fruit imports by publishing all the "differences"—plus or minus—in the two years' supply in our January stock-taking paragraph; and these figures the Board of Trade did not think it worth while to furnish. In the matter of—

Exports

a decrease of £2,235,444 has to be recorded; some of this decline is due to a falling-off in the export of textile, some to a decline in values. Idle ships do not always signify dearth of export freight; much of the unemployed tonnage in our ports had been employed in the French trade. The reports from that country for some time past show a heavy fall in both import and export business; as a consequence, the British ships employed by French merchants come home to "wait for orders." And here may be noted the pleasing impression made on all commercial men by the inaugural address of President Cleveland. There seems little doubt as to the fate of prohibitive tariffs, and of other blunders; and we are justified in expressing the belief that by-and-by we will be in a better position as regards our export trade to the United States than we have been for years past.

Birmingham and District Amateur Gardeners.—A meeting of the Amateur Gardeners' Association was held on the evening of Wednesday, 1st inst., at the Temperance Institute. There was a very large attendance. A good number of new members were elected, making a total membership of over 100. A paper was read by Mr. George Pressly, on "Seeds: Seasonable Hints."

Frédéric Schlumberger.—We regret to hear of the death, on the 21st ult., in his seventieth year of this gentleman, long known as an enthusiastic horticulturist. His collections of Cacti, Orchids, and other plants at his residence, near Rouen, were well-known to connoisseurs.

Botanical Magazine.—The following plants are figured in the March number:—

Rhaphidophora decursiva, tab. 7282.—"The bole of a great tree in an Indian forest, clothed for many feet upwards in this gigantic climber, is one of the most striking objects that the vegetable kingdom displays. Its great trunk, as thick as the arm, hidden by the leaves, sends out innumerable strong horizontal roots like whip-cords, that adhere closely to the bark and its supports, and the glassy green leaves from their abundance, and pendulous position, often completely hide the latter." It is an Indian Aroïd, with bold pinnately divided foliage, yellow spathes, enclosing a thick cylindrical spadix.—Kew.

Bulbophyllum comosum, tab. 7283.—A species in which the pseudobulbs produce two leaves only, and send up from the base a slender stalk, bearing at the summit a deflexed raceme of small white flowers, the elongated segments of which are thickly beset with fine hairs. It is a native of the Shan Hills, and flowered at Kew.

Arundina bambusiæfolia, tab. 7284.—"The most beautiful terrestrial Orchid of Northern India." The leaves are linear-lanceolate, the flowers in loose racemes. Each flower is about 2½ inches across, with flat ovate-acute rosy lilac segments, and a projecting lip rolled round the column, and terminating in a broad front lobe of a deeper violet. It flowered in the collection of F. Wigan, Esq., of East Sheen.

Antirrhinum glutinosum, tab. 7285.—A Spanish species, of trailing habit, with stalked ovate oblong leaves, covered with glandular hairs, and cream-coloured flowers (Hort., Backhouse).

Bulbophyllum Pechei, tab. 7286.—A Burmese species, with single leaves from each pseudobulb, and racemes of small brownish flowers, produced on the ends of a stalk proceeding from the base of the pseudobulb.

Mr. Benjamin Hurst.—This gentleman, a nurseryman of Burbach Grove, near Hinckley, has been placed upon the Commission of the Peace for the County of Leicester. Mr. Hurst, who has served on the Leicestershire County Council since its establishment in 1888, is the senior partner of the firm of Messrs. B. Hurst & Son, merchant nurserymen, Burbage Nurseries, near Hinckley.

C. P. Johnson.—Charles Pierpoint Johnson, author of *British Wild Flowers*, and *Useful Plants*, and contributor to the *Encyclopædia Britannica*, *&c.*, son of the late Charles Johnson, for many years Professor of Botany at Guy's Hospital, died on Monday last, March 6, at 141, Coldharbour Lane, Camberwell.

Devonshire Flowers.—We received, on March 3, from a correspondent at Hollowmead Lodge, Bishopsteignton, a place some views of which appeared in our issue for December 31, last year, a number of beautiful well-developed hardy flowers. These were, naturally, much in advance of plants of the same kinds growing in the home counties, bespeaking the mild character of the Teignmouth district, or at least the favourableness of the late part of the winter there. The packet contained single Violets, Wallflowers various-coloured, with finely-expanded petals; Primroses in a variety of colours; also the flesh-coloured double Primrose, P. Polyanthus, Aubrietia græca, Arabis albida, Hellebores, in variety; Berberis Darwini, B. (Mahonia) aquifolia, with bloom-buds, showing colour Jargonelle Pear-shoots, with flower-buds

on point of opening; Peach bloom, fully expanded; Viburnum Tinus (Laurustinus), Crocus, in variety; Double Daffodils and yellow Alyssum. In addition, there were sprigs of Spearmint, Parsley, and common Thyme, as fresh-looking as if winter had never been. Mr. Willis, the gardener, tells us, in the accompanying note, that the Gooseberry-bushes were "quite green."

Market Fruit and Potato Salesmen.—The annual dinner of the Fruit and Potato Salesmen and Growers attending Covent Garden, the Borough, Spitalfields, Stratford, Farringdon, King's Cross, and St. Pancras Markets, at the Holborn Restaurant, on March 22, is to be, at the desire of the trade, the inaugural dinner of the London Wholesale Fruit and Potato Trades and Growers' Benevolent Society. The Right Hon. the Lord Mayor has consented to take the chair, at the request of a powerful committee representing all the markets in London, and every branch of the trade.

Devon and Exeter Horticultural Society.—The annual report of this Society, while, perhaps, not the best statement which the executive have presented, is yet most encouraging, and shows that the Society still occupies a good position in public favour. The financial statement shows that, commencing the year with a balance in hand of £40 12*s.* 4*d.*, the result of the two shows left the Society with a slightly increased amount in hand, namely, £42 15*s.* 11*d.*

Leyton and District Horticultural Society.—A well-attended meeting was held on Thursday evening, March 2, at the Star Coffee Tavern, Broadway, Leyton, for the purpose of forming a horticultural society; Mr. Fleming, of Beckford Villa, Capworth Street, Leyton, being in the chair. The proposed rules were submitted to the meeting and agreed to, with slight alteration; and more than thirty persons were enrolled as members. The Society will consist of amateur and professional gardeners, a class being arranged for each at the flower show, which it is intended to hold in the summer. Mr. Miles, of Hazlewood, Lea Bridge Road, is the treasurer; Mr. Barnes, 1, Hope Villas, Capworth Street, Leyton, the Secretary. The next meeting will take place on Thursday evening, April 13.

Lincoln Chrysanthemum Society.—The annual general meeting of the subscribers to the Lincoln Chrysanthemum Society was held at the Coffee Palace, High Bridge, on Wednesday night, February 22, Mr. F. Coulling presiding. Mr. Wipf submitted the statement of accounts, which showed that the total receipts for the year were £147 3*s.* 5*d.*

Totterdown and Knowle Flower Show Society.—The annual meeting of the Totterdown and Knowle Flower Show Society was held on Tuesday, February 21, at the Parochial Hall, under the presidency of Mr. E. J. Thatcher. The secretary (Mr. C. Enwright) read the annual report, and the chairman alluded to the increase in the entries from 300 in their first year to 995 last year, when they gave over £69 in prizes. The generally accepted opinion was that last year's show was a most successful one, and the exhibition had now become looked upon as a two-day one.

Bamboos at Kew.—An interesting feature in the Royal Gardens is a plantation of Bamboos in the lower part of the grounds near the Rhododendron walk, and a few types have stood the recent severe weather. The well-known Bambusa Metake is full of health and vigour, and represented by several fine masses. B. Simoni is also uninjured, the large examples of this graceful Bamboo having been little touched by winter frosts. The heavy masses of rich green growth are remarkably effective, and in the variety striata we get a distinct variegation. This is a fine hardy Bamboo, and the same may be said of B. viridis glaucescens. A large group of this is delightful in the garden, and hardy. It is one of the most elegant and pleasing of Bamboos. B. nigra is very dense in growth, and seems little touched by the weather. Although less elegant than such a form as B. viridis glaucescens, it is a handsome kind, the leaves of a full green colour. One labelled Phyllostachys bambusoides has made splendid growth, the leafage pale green, spreading, and very handsome. It is apparently very hardy. A graceful Bamboo is B. Quilioi, compact, and forming a fine mass. Two of the most interesting kinds are B. tessellata (synonymous with B. Ragamowski) and B. Veitchii. Both are dwarf in growth, spreading out in a dense mass. The former has superb leaves, fully 4 inches broad, and 14 inches in length, the colour full rich green. At Kew the plants form a bold group, and have a telling appearance. Those who wish for a good dwarf Bamboo should make a careful note of this kind. B. Veitchi is of similar habit, and a charming species. The leaves are broad, not so long as in B. tessellata, rich green, with deep creamy-white margin—a distinct and bold contrast. Its variegation is not weak, as we get a rich contrast—deep green against creamy-white. *Garden.*

County Council Lectures.—Mr. D. T. Fish is lecturing on Fruit Culture, under the auspices of the Cambridgeshire County Council. The lectures are delivered at Horningsea, Fen Ditton, Quy, Bottisham Lode, Swaffham Bulbeck, Little Wilbraham, and Burwell.

A Windfall for a Gardeners' Association.—A legacy of £300 has just been left to the Birmingham Gardeners' Association, by a person who was anxious to promote its good work, and in recognition of a subscription raised amongst its members to aid the widow and children of a deceased member. The association possesses a valuable library, and there is a large accession of members this winter.

Rose Show Fixtures in 1893.—The following is a list of Rose exhibitions intended to be held during the present year, kindly furnished by Mr. Edward Mawley:—

June 20 (Tuesday).—Westminster (N.R.S.).
„ 28 (Wednesday).—Clifton (two days); Richmond (Surrey), and Windsor.
„ 29 (Thursday).—Eltham.
July 1 (Saturday).—Crystal Palace (N.R.S.).
„ 4 (Tuesday).—Canterbury and Gloucester.
„ 5 (Wednesday).—Croydon, Ealing, and Lee (two days).
„ 6 (Thursday).—Bath, Norwich, and Sutton.
„ 11 (Tuesday).—Wolverhampton (three days).
„ 13 (Thursday).—Worksop (N.R.S.), Harleston, and Woodbridge.
„ 14 (Friday).—Helensburgh.
„ 15 (Saturday).—New Brighton.
„ 27 (Thursday).—Southwell.

Mr. E. Mawley, Rosebank, Berkhamsted, Herts, states that he will be glad to receive the dates of any Rose shows not mentioned above, for publication in his next list of fixtures, which will be issued early in April.

Ealing Horticultural Society.—The report presented at the annual meeting of the above Society showed an income from all sources amounting to £398 12*s.* 7*d.*, and a total expenditure of £397 4*s.* 9*d.*, leaving a balance in hand of £1 7*s.* 10*d.* The Hon. Secretary and Treasurer were re-elected, and it was resolved that the annual summer show this year be held on Wednesday, July 5.

United Horticultural Benefit and Provident Society.—The annual meeting of this Society will take place on Monday evening, March 13, at the Caledonian Hotel. The chair will be taken at 8 o'clock, by George Ingram, Esq.

Royal Horticultural Society of Aberdeen.—The prize schedule for 1893 has now been issued. There are 239 classes, in which 721 prizes are offered. The classes are open to professional gardeners, nurserymen, florists, amateurs, and working classes, and embrace pot plants, cut flowers fruit, and vegetables, including several special classes for Potatos. The fête is to be held on August 17, 18, and 19, in the Central Park, Kittybrewster, Aberdeen, the place where it was held last year.

The Royal Western Horticultural Society held its second annual meeting last week at the Plymouth Guildhall, under the presidency of the Mayor, Mr. W. Law. The annual report stated that the subscribers were to be congratulated on the good work that had been done, and the hopeful future that lay before the Society. The whole of the proceedings in connection with the last show gave general satisfaction. There was expended in prizes £118 18*s.*, and there remained a balance to the credit of the Society of £128 9*s.* 9*d.* Considering they began the first year with a gift of £100 from the Royal Agricultural Society, it was satisfactory to observe that the third year began with a still larger sum in hand. The committee, however, felt that it was very desirable to obtain new subscribers, as the expenses would necessarily increase if the reputation of the Society was to be worthy of the importance of the district which it represented. That would be seen from the following figures:—The subscriptions and money taken at the doors on the occasion of the show in 1892 amounted to £200 8*s.* 6*d.*, and the total expenses for the year amounted to £257 17*s.* 6*d.* The committee thanked the subscribers for the cordial co-operation which they had always received at their hands, and whilst regretting the resignation of Mr. E. J. Winter Wood as Hon. Secretary, they were glad to report that a deputation had been fortunate enough to obtain Mr. John Walling's acceptance of the office. Mr. Paige submitted the balance-sheet for the past year. The receipt side showed:—Credit balance at the commencement of the year, £180 19*s.* 7*d.*; subscriptions and money prizes, £135 5*s.*; cash taken at the show, £65 5*s.* 6*d.*; making a total, with smaller items, of £386 7*s.* 3*d.* The expenditure, including £118 18*s.* given in prizes, amounted to £257 17*s.* 6*d.*, leaving a favourable balance of £128 9*s.* 9*d.*

The Birmingham Gardeners' Association.—At the last meeting of the above, Mr. G. A. Bishop, gardener to S. T. Mander, Esq., Wolverhampton, read an excellent paper on "Chemistry as applied to Gardening," and gave good account of the chemical properties of the soil and composition of plants, and with the aid of experiments, much valuable advice was afforded. A large number of members attended, and many questions were asked, all of which were dealt with in a masterly manner.

The Buchan (Aberdeenshire) Field Club.—Dr. Sinclair, H.M. Convict Prison, Peterhead, recently read a paper on the "Algæ of the Buchan Coast" at a meeting of the Peterhead section of the Buchan Field Club. Dr. Sinclair dealt first with the distribution of Algæ, and then took up the matter of their classification. Referring to the manufacture of kelp, he said in 1818 the price per ton was £20, and the total exports amounted to £120,000, but the price fell to £3 a ton, and rendered the industry unremunerative. He then dwelt on the structure and characteristics of the various plants. In the course of his description of numerous specimens, he had collected, he mentioned at least two which he had been assured on the highest authority were new plants, not found in existing lists. Dr. Sinclair stated his intention to continue his lectures on the subject of Algæ.

Abies Mariesi.—"I spent October 2 and 3 in company with Mr. James Herbert Veitch and Mr. Tokubuchi, an accomplished Japanese botanist, on Mount Hakkoda, an extinct volcano, 6000 feet high, which rises south-east, and a few miles distant from Asmori, the most northern city of the main island of Japan. Botanically, this was one of the most interesting excursions I made in Japan, and we were able to gather the seeds of a number of plants that we did not meet with elsewhere. On this mountain, in the very spot, perhaps, where Maries discovered this fine tree, we found Abies

Mariesii covered with its large purple cones; and on the upper slopes saw the Pinus pumila, forming almost impenetrable thickets, 5 or 6 feet high, and many acres in area, and numerous alpine shrubs like Andromeda nana, Gaultheria pyroloides, Epigæa asiatica, Phyllodoce taxifolia and Geum dryadoides. On this mountain, too, we established the most northern recorded station in Asia of the Hemlock (Tsuga diversifolia); and near the base, Ilex crenata, Ilex Sugeroki, a handsome evergreen species with bright red fruit; the dwarf Ilex integra var. leucoclada, and Daphniphyllum humile were very common; and here we were fortunate in finding good fruit and ripe seeds of Magnolia salicifolia. *C. S. S., in Garden and Forest, February* 8, 1893.

Prize for Botany in Aberdeen University.—Among the matters discussed at a recent meeting of the Aberdeen University Court—the Marquis of Huntly, Lord Rector, presiding—was a letter from Mr. Hector Allan, Sydney, N.S.W., stating that a sum of £75 had been given by the late Rev. Robert Collie, Presbyterian minister, New Town, near Sydney, for a botany prize in the University. The Court unanimously agreed to accept the money, and a remit was made to the Senatus to draw up the conditions of the prize. It was explained that this was the first endowment for botany, and the hope was expressed that it might be added to.

Town Planting in the North.—The Freeman's Committee and Corporation of the City of Newcastle, have decided to plant over 21 acres of ornamental trees, in beltings, on the Town Moor, and the contract for the initial planting of 2 acres of this area was let in autumn last; of the remaining 19 acres, Messrs. Fell & Co., nurserymen, of Hexham, have been entrusted with about 13 acres of this planting. Trees of various kinds suitable for the district are to be planted in specimens, such as Sycamores, Elms, Limes, half-specimens of Mountain Ash, Poplar of sorts, &c., arranged for effect all along the beltings, and which will undoubtedly provide the much-needed shelter, as well as being of ornament.

Dendrobiums in Season.—Various correspondents kindly send flowers of these charming Orchids for our opinion. First, from Charles Winn, Esq., The Uplands, Selly Hill, Birmingham, come his highly-coloured form of Dendrobium × Aspasia (aureum × Wardianum), a fine hybrid (aureum × nobile albiflora), with much clearer and lighter-coloured flowers than other forms of D. Ainsworthii, a curious seedling, very like a highly-coloured D. nobile, of which the parentage (if crossed) is not recorded: and some charming flowers of the natural hybrid, D. crassinodi-Wardianum. From General Emeric S. Berkeley, Spetchley, Bitterne Park, Southampton, come four of the best forms of D. nobile we have seen this year. The one is a nearly white flower, near to D. n. pulcherrimum and D. n. Schroderianum; the next, D. n. purpureum, is, if anything, darker than D. n. nobilius, though scarcely so large. Quite three-fourths of the flower, both back and front, is of a rich dark purplish-crimson. These two forms were imported direct from Western China. The other two are massive flowers, well-formed, and beautifully coloured. They are of the D. n. giganteum importation of Messrs. F. Sander & Co. The petals are $1\frac{1}{4}$ inch broad. From M. Linden, l'Horticulture Internationale, Parc Leopold, Brussels, curiously enough, comes on the same day, a pair of flowers which match in every particular with the richly-coloured D. n. purpureum of General Berkeley; and, lastly, from Mr. A. Empson, The Quinta Gardens, Brobury, Hereford, we receive a set of various varieties of Dendrobium Wardianum of the first order of merit, and exhibiting well the effects of good culture.

Tender Ivies.—The Ivy is usually regarded as a perfectly hardy plant, but several varieties get much injured by a severe winter. An interesting example of this may be seen in the Royal Horticultural Society's Gardens at Chiswick, where there is a large collection of the best kinds. Hedera Helix himalaica is evidently very tender, as every leaf is brown, and the beauty of the plants spoilt. It is important to know this, as it is in the winter that one wishes the Ivy to appear in its brightest dress. If they were very young, the case would be different, but the Chiswick specimens are thoroughly well established, extending over much area. In sheltered and more exposed positions, the effect of frost is the same; and about as much injured is H. H. algeriensis variegata and H. H. maderiensis variegata. The variegated kinds are naturally more tender than the green-leaved, but none of the many varieties are more injured than himalaica.

Can Plants Digest Fatty Oils?—This curious question has recently been answered in the affirmative by Herr R. H. Schmidt, in *Biedermann's Centralblatt*, 1892, pp. 113—115. Experiments with certain moulds growing in a solution containing Grape-sugar, Almond-oil, pure Olive-acid, and glycerine, showed that such a solution could support mould-growth. Fungi were found to flourish in glycerine and fatty acids. Mosses will absorb oil and Olive-acid, whilst many germinating plants, like Peas, will readily absorb and digest fatty oils.

Pamphlet on the Potato.—Mr. James Dobbie, the founder of the firm of Dobbie & Co., florists and seedsmen, has published a pamphlet on the propagation and culture of the Potato, with directions how to avert disease. Mr. Dobbie's reputation entitles his opinions on this question to much consideration.

Publications Received.—*Index Seminum in hortis Musæi Parisiensis collectorum anno* 1892. *An Account of British Flies*, by F. V. Theobald. Vol. I. (Elliot Stock).

THE MIDDLEMAN.

[Empties not Returned!]

During the agitation for the emancipation of the slaves, a favourite cry of the Abolitionists was, "Is not the black man a man and a brother?" Now, in our case our colour may be as dark as it is represented, but I am certain of one thing, that outsiders in general will not admit our claim to be treated as business men and brothers. The one topic with which a writer or speaker may be certain to gain favour of an agricultural or horticultural audience is an attack on the "middleman"—by middleman meaning the salesman. There is reason for this: the gentlemen referred to are all as ignorant of their subject as the audience they address, therefore use the arguments the latter have in their minds. It is not popular to defend the middleman, and papers must cater to the taste of their customers. It is not that nothing can be said for the middleman; his very existence as such is a proof of his utility. If the grower wears out the middleman's empties without his earning anything on them while they are being worn out, can it be wondered that some middlemen, brought up in the school where it is firmly believed two wrongs make a right, do not return to a fraction all the goods consigned to them make. The empties must be paid for in some way, for the commission is gauged to barely pay for the empty while it is being used for the purpose for which the charge is made. How many who complain of want of honesty on the part of the middleman can hold up their hand and thank goodness they are not as other men—that they have never grown Cucumbers in Cucumber-trays, or seeds in boxes with the lids off, or dried bulbs in the latter, and used handle baskets for every purpose short of carrying water! Are the tales of rows of cottages in the Southampton district nearly built of Strawberry boxes devoid of a substratum of truth? Have not hen-coops, dog-kennels, and fowl-houses been seen with the words Borough or Covent Garden stencilled on them over a hundred miles from either locality? Is it to show contempt for the middleman that his sacks are used as door-mats? Let the grumbler reflect how useful he finds that middleman and his empties, and straightway compose an ode in his praise—he is a good citizen, a useful man. Who finds the baked Chestnut-vendor with the two-bushel baskets upon which is placed the portable furnace? he does. Whose baskets form the stall of every old Apple woman in London? his do. Where would the greengrocer be without the middleman's pecks, halves, and bushels to make up the shop front? (I counted seventy in a shop-front near Islington Cattle Show.) Whose barrels are used for corn-bins, coal-boxes, and dust-bins? whose sacks keep the rain off seven-eighths of the carters of the kingdom? What more useful to make up the seat of the driver of a growler than two or three sacks folded? what makes a better apron, with some sieve-cord for strings? nothing is better to dry fish upon in fried fish shops than the lids of hampers and flats; bottled beer packs as well in the latter as anything; and nothing is more useful for pic-nics. In the holiday season there is not a middle-class family who visit the seaside who do not show their appreciation of the middleman by using some of his empties for one purpose or other. I never go anywhere without seeing evidence of the use of the middleman; all use him, from parsons to shoe-blacks. If I have trespassed upon your space my excuse is, that this letter will be about the only one on this topic, if those who reply are those, and those only who have never used a salesman's empties for any other purpose than that for which they were sent, or who have winked at their being so used—sending presents packed in them to friends or using them just to to send a few things to the local shops and customers to count as disqualifying. In the remarks about prices it is apparently forgotten the middleman has often the grower competing with him; so far as rough vegetables and fruit are concerned, this is always the case in Covent Garden, the Borough, and several other markets, and competition is so keen that no rings are in existence, even if it were possible to form them. The mere fact of two salesmen returning the same price is no evidence of collusion. At Sandown, in the ring, you do not find much variety in the price offered for one horse, and it has to be borne in mind that prices in any market are in reality settled by the buyers—not the salesmen. There are black sheep in most flocks but as honourable men are to be found in the markets as in any trade or profession in the country, considering few ever retire from business. A walk round the seven fruit and vegetable markets of London will show that as a body, neither masters nor men are old; and taking into consideration the comfortless life all of them lead, they deserve better treatment at the hands of the public.

If a middleman may suggest anything, it is that all growers should insist that they be charged with the cost of the empties sent them, also for their use if not filled and returned in a reasonable period. If that were done by all, and the buyers charged full prices for all empties sent out, the trade would be on the road to being conducted in a more strictly business manner. But as long as the present loose system prevails, there will always be some middlemen who will think they have a moral right to get back their losses somehow or other, and some growers think they are only acting justly while wearing out that middleman's empties without the owner benefiting. *W. Whitehead Cousins.*

VEGETABLES.

VEGETABLES IN SCOTLAND.

Though the past season, cold and sunless as it was caused loss in most of the tender classes of vegetables in northern parts, it is satisfactory to know that many of the well-known hardy species grown by cottager and landowner alike throughout Scotland, were above the average in quality. There is no doubt that much of their success is due to the system of trenching the land so generally practised in northern gardens, as it is well known that deep

tillage makes it to a great extent proof against the evils of excessive cold rains as well as severe drought; and as some of the finest late Peaches and Grapes ever seen in Scotland, were grown in 1892, with roots in outside borders, indicate that the advantages of thorough drainage are fully appreciated; and though the season was one of the coldest and most sunless, difficulties arising therefrom were met and combated successfully. We have had verbal, as well as written, reports from some of the champion competitors as to the varieties which have helped them so ably to carry off their prizes, and who certainly know well what were tabled at Edinburgh, Glasgow, and Stirling, in such fine form, and so justly admired. I have before me a letter from one of the most successful competitors of late years, an enthusiastic gardener who, when competing against the fine productions of older hands than himself, and who have been for a much longer time exhibitors—I refer to Mr. Fender, gardener, Cultoquhey, near Crieff. While referring to some vegetables which he had shown, he gave a statement with regard to those kinds which were so very satisfactory in all respects in the gardens at Cultoquhey. Cauliflowers, which have been as fine as could be desired, consisted of a selection of Dwarf Erfurt, Veitch's Autumn Giant, and Drummond's Late Frankfort, which gave good supplies up to January. Carrots, and some rare model roots were exhibited by him, were represented by Veitch's Matchless and Scarlet Model. Beetroot, so handsome and dark, were Dobbie's Red. Celery, Standard Bearer and Dobbie's Red and White, of both of which he speaks of highly. The varieties of Leeks were the Lyons and Dobbie's Champion—the two best. Musselburgh, when true, seems still in great favour, it being generally useful and hardy. Beans, broad, Bunyard's Exhibition and Green Windsor were the finest, and in the collection of vegetables were of first-rate quality. Kidney Beans of many varieties were last summer almost worthless in northern gardens, and required glass protection. Tomatos were very fine; Ham Green Favourite and Perfection were the finest in Mr. Fender's list. Cucumbers Lockie's Perfection and Rollinson's Telegraph stood highest, both for free bearing and fine quality. Craig's Favourite was regarded as being the best among Brussels Sprouts. Broccoli for evenness and hardy constitution are represented by Gordon's Wilcove and Cattell's Eclipse, but, no doubt, like other Broccolis, they have been well tested since Mr. Fender wrote his notes. Peas are very fine, though unusually late in turning in for use; Veitch's Perfection, Duke of Albany, and Ne Plus Ultra gave greatest satisfaction. Onions, which are always strong in Scottish collections of vegetables, are not named in the list before me, but I had most of the varieties named at the exhibitions already referred to, and few equalled, while none surpassed, Veitch's Main Crop. These are in fine condition, and are keeping well with me. Potatos are passed over, as they are seldom good in quality at Cultoquhey. There is a nonsensical system of forming two distinct exhibits at northern shows with Onions, viz., spring sown and autumn ditto. We know well that what are often termed spring sown are already on the way; in fact, at the turn of the year, we learn from some of our exhibiting friends, that the competition Onions are sown and worked at with greater zeal and care than exotics. By the foregoing, we have simply noted some of the cream of common vegetables which have been in every way satisfactory during the past season, and from a district in Perthshire not of the mildest or most favoured, we are sure that they may be grown well elsewhere. *M. Temple, Stirlingshire.*

PARSNIP EATEN BY VOLE.

For the specimen whence fig. 44 was taken, we are indebted to Mr. Noble. If the word leather be confined to the tanned hide of an animal, then the legend to the cut is not correct, as the object represented is the rind of a Parsnip; but it was of leathery consistence, and by turning it upside down, the resemblance to a goblet or bottle was obvious. Further, the bottle was an empty one. The hungry edge of appetite on the part of the short-tailed vole had sufficed to clear away the substance of the root as perfectly as it could have been done by any knife. It was suggested that the animal had thoughts of further utilising the root as a home for voles.

HOME CORRESPONDENCE.

ERYNGIUM CAMPESTRE.—Is it certain that Eryngium campestre grows on the seashore? This plant, with Sambucus ebulus and Urtica romana, are found rarely along the course of the Watling Street Road, where I have collected the two first. *R. T. C.*

QUOTATION RESPECTING SAGE.—The line your correspondent quotes is a translation of the old monkish double rhyme—

Cur moritur homo cui salvia crescit in horto?

Here is another:

Caseus est nequam, quia dig rit omnia se quam.

R. T. Clarke.

APPLE ARMOREL.—I draw attention to the Apple figured by you last week for two reasons—first, as to the correct name, although it is not in the plight of the threatened Bezonian. Whilst Mr.

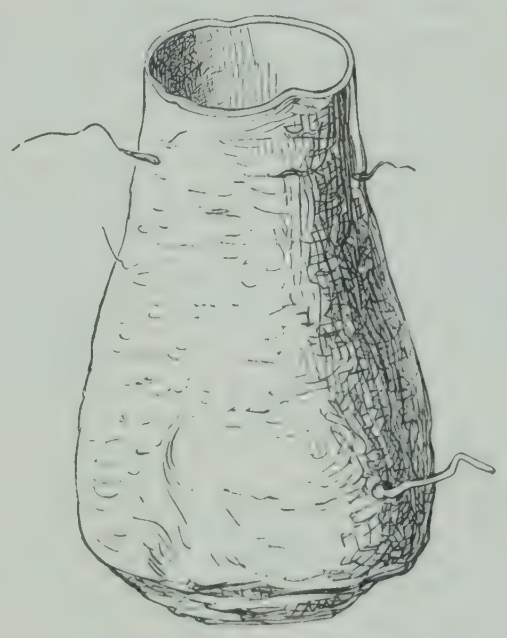

Fig. 44.—A "leather bottel."
(Reduced one-half.)

Cheal terms it Armorel—and you adopt that spelling—when certificated it was named Amorel, or with only one "r." Perhaps Mr. Ross will be the referee in this matter. Then, whilst the variety was certificated last year, it is not well remembered that this Award was unanimously made at the Temple Show last May, the 25th, thus showing it to be one of the very best late or long-keeping of dessert varieties. Although strictly a Russet, yet it has a golden tint, and is of its section distinctly handsome. *A. D.*

POISONING BY HELLEBORUS FŒTIDUS.—A friend of mine lately lost two valuable cows by poisoning. It appears he had plants of Helleborus fœtidus growing in the shrubbery, and the trimmings from them with other garden refuse were placed where the cows run, with fatal effect. As it may not be generally known how very deadly this stinking Hellebore is, I send this note. *George Bunyard, Maidstone.*

EUPATORIUMS, ABUTILONS, ETC.—Among the most useful winter and spring-flowering plants for an ordinary greenhouse we must certainly include two or three varieties of Eupatoriums. The genus contains over 400 species, but very few of them are worth cultivation. The four which I have found really worth growing are E. ianthinum, E. atrorubens, E. Weinmannianum, and E. riparium. The first of these has purple flower heads, while those of the second are reddish-purple and lilac, whilst the last two are white, and the whole of them flower naturally in the order named. I know of no plants more easy to grow than these Eupatoriums, or which are more easily propagated in the spring if young shoots are made into cuttings, and placed in gentle bottom-heat and kept close. A generous treatment of the plants after they come out of the propagating bed will secure good specimens full of flowers. I afford the same sort of treatment to Eupatoriums, Abutilons, and Sparmannia africana, of which I will afford a brief outline. All of these greenhouse shrubs flower freely during the winter, when flowers are naturally doubly valuable. In the spring, when the bulk of their bloom is passed, I cut them hard back, knock them out of their pots, remove much of the soil, and repot in a rich compost of a somewhat open nature, and in well but not excessively drained pots. The plants make many roots, and the soil very soon loses its moisture if too many crocks be used in the drainage. Dried cow-dung is an excellent manure to add to the compost, at the rate of one-fourth of the bulk. After repotting, afford them but little water for a few days, and keep them well syringed overhead. When growth has fairly commenced, abundance of water will be required if the potting has not been overdone; and as the pots fill with roots, liquid manure abundantly should be applied. Towards the end of June, or early in July, according to the season, I place them in the open air, where they remain till the middle of the month of September, when they are housed again, and afforded ordinary greenhouse treatment; still supplying them with liquid-manure, and plenty of water at the roots. I do not head-back Eupatoriums, but Abutilons and Sparmannias are headed-back once after their growths have reached about 9 inches in length. Standards may be obtained of these two last by raising a single stem up to the required height, then stopping it and keeping the side-shoots rubbed off for a time. There is much variety of colour in the flowers of Abutilons. All of these plants under notice will remain in flower for a long time, and their time of flowering may be retarded or accellerated with ease by regulating the temperature of the house in which they are being grown. They are well adapted for conservatory decoration, and are far more free from insect pests than the majority of plants. *A. P.*

FOOTPATHS IN PLEASURE GROUNDS.—I should like to have the opinion of landscape gardeners as to the importance or otherwise of the canon in garden paths held most tenaciously by Mr. W. B. Page, who was forty years ago one of our most distinguished of landscape gardeners, as to whether paths should break out from others or from carriage roads obliquely or at right angles. Mr. Page would never pass a path that did not accord to the latter practice. I make this observation because I note those on the plan of the Ramsgate Public Park you figure at p. 269, nearly every path joins others at acute angles. No doubt the arrangement looks pretty, but, with all due deference to modern plan-drawers, I often think that paths are too plentiful in public gardens—too often lead nowhere, and look prettier on paper than they are found useful or desirable in reality. *A. D.*

GROS COLMAR GRAPE.—There has been a good deal of writing lately as to the best methods of growing the Grape Gros Colmar. I have never noticed any suggestions made as to the pruning of this variety. I have grown it for some years, and I find that the long-rod system is far superior to the spur system, both as regards the colour and size of the berries, which would be attributed to the great amount of root-action in Vines having long rods as fruit-carriers. *J. S.*

—— In answer to your able correspondent, W. Simpson, it would be of interest to me, and doubtless to others, to know what is his definition of flavour. I speak of high flavour in Gros Colmar when I can eat and enjoy the fruit, and it would be worth something to know who could prefer the taste of a black Gros Colmar. I do not care to how late a season this Grape is kept, the earthy flavour is always there, and it is even lacking in sweetness. But palates differ, and were it only on the score of sweetness, the paler and beautiful coloured well-grown and sound Grapes are certainly to be preferred to the sloe-black. Strictly-speaking, there is scarcely any flavour in Gros Colmar when grown on its own roots, yet there is no Grape which can equal it for market purposes. I certainly consider it prudent if the gardener errs on the side of light cropping, and that for many reasons, some of which are doubtless known to W. S. Admitting that the higher-coloured Grapes do command a higher price in the market, would it surprise

W. S. to know that, even with this higher figure, it has always paid me the best to grow a heavier crop, that may be wanting in finish, but of still sound Grapes, of good keeping quality. Early in the present year I was asked to supply a sample bunch for an artist of repute, and although I had bunches that were furnished with much darker berries, I selected one of a violet shade, to the satisfaction of the person named. Without dealing with the last paragraph of his cutting article, I beg to inform him that I have carefully measured the length of rod of one of the heaviest-cropped Gros Colmar (I had one heavier of Black Alicante). Weight in each case can be certified by one of the proprietors here, as also the dates when cut, and to whom the Grapes were sent, and it is exactly 12 feet, with fourteen spurs on each side. Every spur carried one bunch of Grapes—twenty-eight in all—the whole turning the scale at 56 lb.; and, so far as I am able to judge by the strength of the laterals, it is quite equal to carrying the same weight of fruit this season. The first lateral, or spur, is 6 inches from the ground-level. This Vine was planted in 1889—a fruiting-cane from a No. 8 pot—and it carried two bunches the same season, and four or five in 1890, and twelve in 1891. Every Vine in the vinery in which is this rod stands at 3 feet asunder, that is, single rods. As a market-grower—or, rather, a shop-provider—I know that it would be folly to suppose that customers could be retained year by year, and dozens of them, unless I gave them the quality of Grape that they liked. At the same time, I market a quantity; and when I say we send bi-weekly a journey of 500 miles, it will be understood that the carrying quality of the Grape must be good. I suppose I have cut over 2 tons of Gros Colmar since September, so that I think I am entitled to say, without presumption, that I know a little about flavour and of colour. I had nothing to gain in penning the line in which the pointed remarks of "Vagabond" were referred to, and trust this will fully satisfy W. S. In conclusion, although I have never said that I had many Vines which bore the extreme weight quoted, there are several that have carried from 30 lb., 40 lb., and 42 lb. These were planted by my predecessor, yet they are good and strong, and with suitable stimulus and good culture will last some years. What I know surprises my fellow-craftsmen when looking round the place is, first, the crop, and then the foliage and wood; depend upon it, if the last two are right, the crop will be a good one. *Stephen Castle, Fordingbridge.*

PLUMBAGO CAPENSIS BEDDED OUT.—Allow me to give "W. D." my experience of Plumbago capensis when bedded out. I have made use of the plant for ten years, mixed with Abutilons in one bed, and in another containing white-flowered sub-tropical plants, and mixed with Abutilon, Cannas, Castor-oils, and African Marigold. I plant out both old and spring-struck plants, those raised from cuttings, propagated now, making nice plants by June. The plants flower very freely through August and September. *H. Reed, Downside Gardens, Woking.*

—— The above is spoken of in *The Royal Parks and Gardens of London*, by N. Cole, as a sub-tropical bedding plant. My experience of it as such is, that only well-established plants should be used. Cuttings struck the previous season, and grown on till they come into 48's, are good for the purpose, if they are well hardened off previous to being planted out. Like the old Begonia Weltoniensis, it requires a warm and sheltered position, as it will not thrive if planted in a cold or exposed place in the garden. Some years ago it was used in the grounds at Hamble Cliff, near Southampton, and I see from the notes I then made of it, that, as such, it was a marked success. If used as an ordinary bedding plant, it is better to carpet the bed with Alternanthera magnifica, Coleus Verschaffeltii, or something similar, as it is then more effective. I would add, however, that the soil in which it is planted should not be made too rich, otherwise, it is conducive to too strong a growth. Such is my experience of it. [It makes pretty pyramids, which can be employed alone or as dot plants in beds of other plants. Ed.] *Hedley Warren, Bournemouth.*

"ROYAL" HORTICULTURAL SOCIETIES.—I presume it is open to the committee of any horticultural society to give their particular body a "Royal" prefix if they can obtain proper sanction. More is the pity that such sanction should thus be so freely given, because, after all, we have but one real Royal Horticultural Society, that which has its headquarters in London and Chiswick, is established by Royal Charter, and is even more than national in its operations. I am induced to say so much, because, on looking over a provincial paper, I came across a paragraph referring to the "Royal Horticultural Society" that somewhat staggered me, until reading further I found it referred to some local society that sported this high-sounding appellation, and showed in its report for the year that its finances were in a beggarly condition, having a deficiency of over £70. I can but regard the desire of a mere local body to have their society dubbed "Royal" as simply excessive snobbishness. After an exhibition of this kind one could almost wish that, to prevent possible associations with these puffed-up small bodies, the real Royal Horticultural Society should change its appellation to "National." It would be interesting to learn how many of these little societies there are which assume the grandiloquent appellation of "Royal," and how many of them like the one named are in debt? *D.*

EARLY SPRING FLOWERS.—Perhaps some of my old gardening friends may say what is there to tell about early spring flowers. Why I write is this, knowing many gardens and owners of gardens, I am often surprised to find how few species and varieties of early blooming flowers are grown, and how often it is the old story, Snowdrops, Crocuses, Winter Aconites, a few Scillas, Colchicums, and Primroses. I am frequently asked by friends, amateurs, what is the best time to visit Oakwood garden? the answer usually is that it depends upon taste; individually, I prefer the earliest spring flower season, about the middle of February. There is an especial charm about the first flowers coming after the long wintry weather, sometimes in it, with their bright colours. How beautiful is a large bank of Hepaticas with all the shades of colour! H. angulosa blooming first, then the double pink and blue, and all the different tints of single white kinds, blue and purple. I was told by my friend, Mr. Frank Miles, of a Dutch grower who had raised Hepaticas of very many colours, and was not disappointed with the collection; moss grew up among the plants, and added to the beauty of the bank. Miss North was so taken with the effect, that she transplanted moss to obtain it, but alas! as the moss grew stronger it became injurious to the plants, and we had to grub it up. In old gardens are found big plants of Hepatica, but I do not think that they are now planted nearly enough. Leucojum vernum is becoming more common, but it is not in general use; it makes a good companion to Snowdrops. An effective mode of growing this is in a bed of Sedum pulchellum, where it sows itself and spreads. Leucojum vernum carpaticum, with its stronger growth and two flowers to the stem, is a great improvement on the type. The newer varieties of Snowdrops are getting more into cultivation. Galanthus Elwesii, with its globular form, has very many admirers. Others prefer the long-petalled graceful variety, G. Imperati. One of the finest forms in bloom at Oakwood is G. Melvillei, which I owe to the kindness of the raiser. Good clumps of the different varieties of Saxifraga Burseriana on a bank bloom, I think, better than when grown under glass; but when out, they deserve a bell-glass to preserve the blossoms in rough weather. In warm sheltered corners the many species of winter and early spring-flowering Crocuses hold their flowers well. Anemone blanda, given me by Mr. Ingram, is a gem, and the so-called white form, which with us usually comes a pale blue, is very pretty. Daphne Blagayana resists frost well, and is as sweet as the greenhouse D. indica. Many of the Lent Hellebores, which follow on after Helleborus italicus and H. rexus, are now very beautiful, and fine varieties of them may be raised from seed. Petasites albus, where there is room for it, is not to be despised. All the Scillas and Muscaris are good, but one of the finest earliest flowering of these last came from Mr. Van Tubergen, jun., under the name of Hyacinthus azureus; it is a lovely soft pale blue. There are now a great number of early-flowering common Primroses, with beautiful shades of colour, enough to make a spring nosegay by themselves. Early-flowering shrubs, such as Chimonanthus fragrans and Lonicera fragrantissima, are pretty generally known. I could go on with other flowers, but the space forbids. I think that the early spring flowers of the future will undoubtedly be found among the Irises. I. histrio, now in bloom at Oakwood, has richness of colour which few Orchids can surpass. I. Bakeriana, I. Danfordiæ, and I. histrioides are all most beautiful early flowers, when they become as common and inexpensive as I. reticulata. A large spring bed of Irises will be gorgeous. It is to be hoped that nurserymen will turn their attention to importing or growing the rarer Irises from seed on a very large scale, so that they may be generally grown. *George F. Wilson.*

MESSRS. FOSTER AND PEARSON.

As a firm carrying on an extensive nursery trade, Messrs. J. and R. Pearson & Sons, of Chilwell, lately received notice in our columns. We now give our readers some account of the horticultural building concern of the firm of Messrs. Foster & Pearson, established at Beeston, near the town of Nottingham, as at present existing. The knowledge of plants and their requirements, and especially of the different kinds of horticultural buildings requisite for all kinds of plants and fruits, which must have been acquired by Mr. Henry J. Pearson, of the above firm, during his childhood and youth spent in a successful plant nursery, afford the firm of Foster & Pearson exceptional advantages in devising horticultural structures, a fact that is shown by the reputation their work has for efficiency and durability. Calling at the works, Mr. Pearson kindly undertook to show us round, beginning at the timber-yard and sheds, for it is here, says Mr. Pearson, that the building of good glasshouses really begins. Well seasoned sound timber is the secret of the durability of plant-houses, and all the timber at Beeston is personally selected and stored for three or four years before it is worked up, care being taken that every balk used is of the best quality, for as our guide remarked, if some is good and some bad the house becomes dilapidated almost as quickly as if all is of bad quality. Passing a powerful steam-engine, we enter the workshops, where the workers are busy as bees amidst the clatter of circular saws, planing-machines, machines for morticing and cutting angles or grooves, specially constructed machinery being employed for every kind of work up to the final fitting together. In one place we came to a machine for getting a rough but true face on the larger stuff to be used; then in another the saws which cut it into the required strips, then planes in active work, and so on, to the machine which finishes the bars and rafters off "as true as a hair" in sets. We then went to the paint shops, where Mr. Pearson shows us what he considers another absolute necessity in the making of a good horticultural building, viz., the finished work having a coat of red lead. For this we received many technical reasons, but the fact that common sense supported the argument was not the least weighty with us. When this priming of red lead is dry, the various pieces are passed on to the painters, and are in this dry shop finished all but the final coat, which is far better than having to do the work in the open air.

The carpenters' shops were entered, where the fitting together of the lighter work is carried on, and a quantity of sash bars, materials for forming staging, and other kinds of material are stored, so that it might get well seasoned before they are required for building.

The blacksmiths' shops showed much of that light kind of iron-work which gives strength to glasshouses, and which, in this case, is ornamental as well as useful. We witnessed the selection of some very large iron-work of an ornamental kind, intended for a conservatory in the course of erection for a customer. This was all laid flat on the floor, a number of workmen being engaged in filing the joints to the greatest nicety, fitting them with nuts, screws, &c., and in fact placing the whole in the exact position it would occupy. There are special features in the works worth seeing, the first being their vineries and fruit houses built on iron standards instead of ordinary brick walls, and which possesses the undeniable advantage of giving the roots of Vines, Peaches, &c., planted inside, but which it is intended should run outside, an uninterrupted course for so doing, whereas the ordinary arched

brick wall is, to some extent, an obstruction. Another advantage of a house standing on these iron standards is, that it can be built so as to be a tenant's fixture removable at will.

The system of using iron standards also is extended to the better class of frames, and several forms of frames with doors, for fixing on brick walls or over a sunken pathway, are admirable things for the amateur in a small way; being indeed to all intents and purposes small neat houses, economically fitted at little more cost than the ordinary span garden frame. Another kind of frame which would be of great advantage if fitted against a hothouse wall where it could obtain some slight warmth from the house, is the lean-to frame with flanges to the iron bars at the back for fixing it to an existing wall.

About the whole of the work at this establishment the most casual observer cannot fail to remark on several very fine points, and notably the excellence of the system of tie-rods, light purlines, uprights, and angle-irons which are arranged on true principles of thrust and pull, as to render it next to impossible for any part of the structure to shift its position, or for sagging of any part to take place. Moreover, this kind of iron is ornamental in design. The methods of ventilation adopted are excellent, the iron traps being provided which have perforated zinc sheeting on the inner side, and which are suspended on a balancing pivot, and the end-to-end lantern ventilation at the highest point of the ridge is apparently perfect. Returning to the draughtsman's room and offices to inspect the plans of some of the large works carried out in various parts of the country by the firm, we stepped aside to see the working of the patent valves and joints used here in the laying down of the hot-water piping, the planning of which has been a special study, which seems to have arrived at something very near perfection.

COLONIAL NOTES.

COFFEE DISEASE IN JAMAICA.

The Ceylon Coffee disease caused by Hemileia has happily not been met with in Jamaica, though other less serious fungus pests have been discovered by J. D. A. Cockerell. These are the black rot, Pellicularia keleroga, which affects the leaves somewhat in the same way as the Potato fungus (Phytophthora) and the iron-stain "mancha de ferro," of Venezuela, which is attributed to Stilbum flavidum, and which forms small pale brown spots on the leaves, which speedily fall off. Neither of these has any close relation to the Hemileia, and their effects are much less serious.

Bulletin of the Botanical Department of Jamaica.

The last number contains the Report of the Director of Public Gardens, for the year ending March, 1892. It contains an interesting account of the functions performed by colonial gardens, and a slight sketch of the history of each of the establishments in the island. "The value of the gardens existing in Jamaica, Trinidad, and Demerara, is so evident that lately Botanic Gardens have been started in Antigua, Dominica, Montserrat, St. Kitts, and Nevis, amongst the Leeward Islands, under the direction of Mr. C. A. Barber, a Cambridge botanist; in Grenada, St. Lucia, and St. Vincent amongst the Windward Islands; and still more recently in British Honduras.

"The same movement is also going on in other parts of the world; for instance, botanic gardens have lately been established in Lagos, and the Gold Coast on the west coast of Africa.

"Botanic gardens in the Tropics do the work on the plant side, of agricultural departments in temperate climates. They are in themselves experimental stations; and are much more efficient in introducing new cultural products, and in distributing plants and imparting useful information than most agricultural departments.

"The whole of the botanic gardens in the British Empire are more or less in communication with one another, exchanging seeds, publications, &c., and all look up to the Royal Gardens at Kew as to their head for advice and assistance. Imperial federation is already in existence as regards the botanic gardens and their work. If any special variety of a plant, or any new culture comes into notice, information and plants are sought sometimes directly from the local gardens, sometimes through Kew as the botanic gardens' 'Clearing House.' The Director of Kew Gardens has at his disposal the services of experts in every branch of botanical inquiry, and is always most willing to aid colonial gardens in every way. Any intricate question that arises in chemistry, in diseases of plants, in insect pests, in the value of products, &c., can be determined by reference to Kew. Colonial gardens are therefore not isolated, but are branches of an agricultural department as wide as the British Empire itself." We are pleased to see that the resources of the Royal Horticultural Society have also been utilised. A closer interrelation between the Society and the colonial and foreign botanic gardens is greatly to be desired.

TREES AND SHRUBS.

HAMAMELIS.

The genus Hamamelis, or Witch Hazel, consists of a few—half-a-dozen—species of deciduous shrubs and half trees, whose flowers appear in the winter and early spring. They are natives of North America and Japan. Although flowering with freedom at a season when out-of-door flowers are scarce in this country, they are to be found in but few gardens—at least, the Japanese representatives of the genus, notwithstanding the fact that they require very simple methods of culture, and are not fastidious as to soil, flowering freely in damp and in dry soils if the position be a sunny one. Their hardiness in this country is established, plants having stood out unprotected at Kew during recent winters. The undermentioned species are worthy the notice of gardeners.

H. virginica was introduced from the Eastern United States to this country in 1736, and therefore it is the best known species, and though its flowers do not possess the brilliancy of colour characteristic of H. arborea, it is certainly a delightful shrub. Its numerous bright yellow star-shaped flowers appear in clusters soon after the leaves have fallen. After the petals have fallen, the greenish-coloured calyces remain on the plants until growth recommences in spring. It is a plant admirably suited for the margin of water-courses and lakes, as it loves a cool and moist soil. In this country it takes the form of a dense bush of 6 to 8 feet in height, but in its native country it attains to a height of 18 feet.

H. arborea is unquestionably the brightest and freest early spring-flowering small tree that we possess, and beyond doubt the most beautiful of the genus. It was received from Japan thirty years ago, but it is only within the last few years that it has received anything like the attention it deserves. So freely are its clusters of blossoms produced, that every branch and twig is wreathed with them. The twisted petals are of a rich golden-yellow, and about half-an-inch long; the calyx is claret-coloured. The plant differs from the other species by reason of its tree-like habit of growth, which in Japan is about 20 feet, but in England it rarely reaches 10 feet; the Japanese species flowers whilst still very young. The beauty of the blossoms are much enhanced if the shrub has evergreen shrubs at the back of it. The Kew plant is growing in almost pure sand, but every year it is laden with bloom. It is a sun-loving shrub or small tree, and should always be planted where its wood may get thoroughly matured.

H. japonica is very different from H. arborea, a species for which it is sometimes taken. It is of dwarfer and more bushy habit, with flowers of a soft sulphur-yellow colour, rather sparsely produced, and appearing a fortnight later than those of H. arborea. It likewise flourishes in a sunny aspect.

The propagation of these shrubs, which does not seem to be generally understood, is carried out in the following manner. The raising of the American species is generally by means of seed freely produced in this country, which should be sown in porous soil in well-drained pans or boxes, placed in a temperature of 55°. When the young plants are large enough to be handled, they should be pricked off into beds or pots, to be afterwards potted off into 60's; these may be grown on either to form bushes, or as stocks on which to graft the more choice kinds. Grafting is best performed in the month of March, and side-grafting is the better method to adopt. The scions should be of well-ripened wood and a trifle smaller in diameter than the stock; ordinary bast forms a good material for securing them. It is hardly necessary to say that the knife used should be very sharp. When the graft and stock are properly bound together they should be placed in a close propagating case for a few weeks until a union is effected, afterwards placing them in a frame, the amount of ventilation of which should be small at first and be gradually increased. *T. H.*

ENQUIRIES.

Canning Fruits.—Is there any book on this subject readily available? *J. B. W.* [We do not know of any on this side of the Atlantic. Perhaps some of our American correspondents would kindly indicate the name, cost, and place of publication of such a book. Ed.]

Lantern Slides.—Where can I procure lantern-slides illustrative of good fruits and vegetables? I require them to exemplify lectures on gardening. *M. A.*

Mandragora Trees.—What can the author of *Morocco as it is* mean when he says, p. 45, that the Sultan "wanders beneath the Mandragora trees of his magnificent garden in Fez?" *X.*

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature.		Accumulated.				Rainfall.			Bright Sun.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending March 4, is furnished from the Meteorological Office :—

"The *weather* continued in an unsettled condition in all parts of the kingdom, with a good deal of rain in all the more southern districts, and heavy snow, sleet, and rain in the north.

"The *temperature* was rather below the mean in 'Scotland,' as well as in 'England, N.E. and Ireland, S.,' and just equal to it in 'England, N.W. and Ireland, N.;' in the other districts there was an excess of 2° or 3°. The highest of the maxima were recorded, as a rule, either on March 2 or 4, when they ranged from 60° in 'England, S.,' and 59° in 'England, E. and S W.,' to 52° in 'Scotland, E.,' and 51° in 'Scotland, N.' The lowest of the minima were registered on February 26 or 27, when the thermometer fell to 11° in 'Scotland, E.' (at Nairn), to 16° in 'Scotland, N. and England, N.W.,' and to 17° in 'Scotland, W.;' elsewhere the minima ranged from 21° in 'Ireland, S.,' and 22° in 'Ireland, N.,' to 31° in 'England, S.,' and to 38° in the 'Channel Islands.'

"The *rainfall* was rather less than the mean in 'Scotland, N. and Ireland, S.,' but more in all other districts. Over the northern parts of England and the east of Scotland, the excess which was large, was chiefly due to a heavy fall of snow and sleet occurring at the opening of the period—1·3 inches being measured at Alnwick Castle on the 26th, 1·0 inch at Shields, and 0·9 inch at Aberdeen.

"The *bright sunshine* slightly exceeded the mean in some of the western districts, and in central England, but showed a deficit elsewhere. The percentage of the possible duration ranged from 31 in 'England, S.W.,' and 30 in the 'Midland Counties,' to 18 in 'England, S.,' and 14 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, March 9.

Supplies quite equal to the demand. Trade quieter. *James Webber, Wholesale Apple Market.*

SEEDS.

London: *March* 8.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that a fair sowing demand now prevails for field seeds. The sodden state of the land somewhat delays country buying. Clover seeds all round exhibit this week no quotable change. Italian and perennial Rye-grasses keep strong. Spring Tares are scarce, and realise full prices. For bird seeds the trade is slow. Peas and Haricots are neglected. Rape seed is firmer, Mustard keeps strong. For White and Scarlet Runner Beans there is an improved inquiry.

FRUITS AND VEGETABLES.

Spitalfields: *March* 7.—Quotations:—Brussels Sprouts, 1*s.* 3*d.* to 1*s.* 6*d.* per half-sieve; Turnip tops, 2*s.* to 2*s.* 6*d.* per sack; Sprouting Broccoli, 2*s.* to 2*s.* 6*d.* do.; Curly Kale, 1*s.* 3*d.* per bushel; Seakale, 1*s.* to 1*s.* 3*d.* per punnet; Savoys, 2*s* to 3*s.* 6*d.* per dozen; Cauliflowers, 3*s.* to 6*s.* 6*d.* per tally; Greens, 1*s.* to 1*s.* 6*d.*; Turnips, 2*s.* to 3*s.*; Carrots, 2*s.* to 3*s.* per dozen bunches; forced Rhubarb, 1*s.* to 1*s.* 6*d.* per dozen bundles; Horseradish, 2*s.* to 2*s.* 6*d.*; Celery, 1*s.* 3*d.* to 1*s.* 8*d.* per bundle; Parsnips, 40*s.* to 50*s.*; Carrots, 50*s.* to 60*s.* per ton; English Onions, 10*s.* to 10*s.* 6*d.* per cwt.; Spanish do., 9*s.* to 10*s.* per case; Belgian do., 7*s.* to 7*s.* 6*d.* per bag of 110 lb.; English Apples, 3*s.* 6*d.* to 7*s.* per bushel; American do., 15*s.* to 22*s.* per barrel.

Borough: *March* 7.— Quotations:—Savoys, 3*s.* to 6*s.* per tally; Brussels Sprouts, 1*s.* 3*d.* to 1*s.* 6*d.* per half-sieve; Turnip-tops, 1*s.* 6*d.* to 3*s.*; Broccoli, 1*s.* 9*d.* to 2*s.* 6*d.* per bag; Greens, 1*s.* 6*d.*; Parsley, 3*s.*; Carrots, 2*s.* 6*d.* to 3*s.* 6*d.*; Turnips, 1*s.* 6*d.* per dozen bunches; English Onions, 10*s.* to 12*s.* per cwt.; Dutch do., 10*s.* per bag; Horseradish, 2*s.* 3*d.* to 2*s.* 6*d.* per bundle; Apples, 4*s.* 6*d.* to 6*s.* per bushel.

Farringdon: *March* 9.—Quotations:—English Onions, 10*s.* to 11*s.* per cwt.; Carrots, 50*s.* to 60*s.* per ton; Turnips, 45*s.* to 55*s.* do.; Parsnips, 50*s.* to 60*s.* do.; Apples, American, Golden Russets, 21*s.* per barrel; do., Baldwins, 15*s.* to 18*s.* do.; Pine-apples, 1*s.* 6*d.* to 2*s.* 6*d.* each; Grapes, Cape, 7*s.* per box; Tomatos, 2*s.* 6*d.* do.

Stratford: *March* 8.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned prices:—Savoys, 1*s.* 6*d.* to 4*s.* 6*d.* per tally; Greens, 1*s.* 6*d.* to 2*s.* per bag; do., 1*s.* 6*d.* to 2*s.* 6*d.* per dozen bunches; Cauliflowers, 1*s.* to 1*s.* 6*d.* per dozen; do., 5*s.* to 7*s.* per tally; Turnips, 40*s.* to 63*s.* per ton; Carrots, household, 40*s.* to 50*s.* do.; do., cattle, 24*s.* to 36*s.* do.; Parsnips, 6*d.* to 9*d.* per score; Mangels, 16*s.* to 20*s.* per ton; Swedes, 12*s.* to 20*s.* do.; Onions, English, 200*s.* to 210*s.* do.; do., Dutch, 7*s.* to 8*s.* per bag; do., Bordeaux, 5*s.* to 7*s.* 6*d.* per case; Apples, English, 2*s.* to 6*s.* per bushel; do., American, 12*s.* to 20*s.* per barrel; Brussels Sprouts, 1*s.* to 1*s.* 3*d.* per half-sieve; do., 1*s.* to 2*s.* per flat; Sprouting Broccoli, 2*s.* to 3*s.* per bag; Turnip Tops, 2*s.* to 3*s.* per bag.

POTATOS.

Spitalfields: *March* 7.—There is no alteration to report in prices.

Borough: *March* 7.—Quotations:—English Magnums, 45*s.* to 60*s.* per ton. Others unaltered.

Farringdon: *March* 9.—Quotations:—Main Crop, 80*s.* to 90*s.*; Sutton's Abundance, 75*s.* to 85*s.*; Magnums, 55*s.* to 65*s.*; Bruce's, 60*s.* to 70*s.*; Imperators, 60*s.* to 65*s.* per ton.

Stratford: *March* 8.—Quotations:—Magnums, 45*s.* to 80*s.*; Bruces, 50*s.* to 65*s.*; Imperators, 45*s.* to 60*s.* per ton.

London Averages: *March* 8.—Magnums, 45*s.* to 60*s.*; Hebrons, 65*s.* to 80*s.*; Imperators, 55*s.* to 70*s.*; Regents, 70*s.* to 85*s.*; Belgians, 50*s.* to 60*s.* per ton. New:—Jerseys, 6*d.* to 10*d.* per pound.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending March 4, and for the corresponding period last year:—1893: Wheat, 25*s.* 1*d.*; Barley, 25*s.* 2*d.*; Oats, 17*s.* 11*d.* 1892: Wheat, 33*s.* 3*d.*; Barley, 27*s.* 9*d.*; Oats, 20*s.* 6*d.*

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80*s.* to 112*s.*; do., inferior, 70*s.* to 75*s.*; hay, best, 75*s.* to 112*s.*; do., inferior, 65*s.* to 75*s.*; and straw, 28*s.* to 44*s.* per load.

TRADE NOTICE.

Messrs. Koster & Co., of Hollandia Nurseries, Boskoop, Holland, desire to announce that they have given to their nurseries the name of "Hollandia Nurseries," so that their clients may not be mistaken in addressing letters to their firm.

Answers to Correspondents

Draining Field full of Marestail (Equisetum): *G. A. P.* The roots of the plant having closed the drain-pipes, it would be best to lay-in rubble drains at a depth of between 3 and 4 feet, and 25 feet apart. The roots of the plant are not likely to fill up the interstices in the rubble, but care should be taken to put fine gravel or sods, grassy-side downwards, over it.

Early Volumes of the Transactions of the Horticultural Society of London: *T. O.* They are not of much money value unless you have a complete set. You might advertise them.

Fungus on Timber: *T. B., Nottingham.* A form of dry rot. Take out and destroy by fire all the affected wood-work. See *Gardeners' Chronicle*, November 13, 1886, p. 626.

Insect on Peach: *Anxious One.* A species probably of Lecanium, scale; fuller answer shortly. For its destruction, washing with petroleum emulsion, white-washing, brushing off the insects from the branches.

Lælia crispa: *J. Krupp.* See "Names of Plants" in our issue of February 25.

Names of Plants: *Cornwall.* Rubus spectabilis.—*J. R.* Lopezia racemosa.—*W. Z.* Yes; the specimens arrived in good condition, which is of rare occurrence, we are sorry to say. 1, Lomaria gibba; 2, Pteris cretica albo-lineata; 3, Pilea muscosa (Artillery Plant); 4. Spathiphyllum Patini; 5, Cyperus alternifolius; 6, Pteris serrulata.—*F. A. G.* Fuchsia bacillaris.—*R. C. Townsend.* Next week.

Rhododendron: *G. D.* It looks like a variety of R. argenteum. Can you send us a leaf?

Scale on Bast Ties: *W. C.* Shows how necessary it is to renew old ties on trees affected with scale when dressing them in the winter. You might try a weak mixture of petroleum and soapy water, one wineglass of the former to one gallon of the latter. In winter, a smothering dressing of clay, soot, soft-soap, lime, and sulphur, does much good.

Seeds of Odontoglossum triumphans: *S. E. B.* It is of great rarity for perfect seeds of any species of Odontoglossum to be obtained on home-grown plants. The germinating qualities of the seeds would be difficult of determination without actually sowing them. If good, plants should appear in six months under favourable conditions. The critical time with Orchid seedlings is in what may be called the thallous period, that is, between germination and the formation of roots. The temperature to employ at this season should range from 55° to 65°.

Snails: *Correspondent.* The shell is Vitrea alliaria, of Miller, and the only means for dealing with them is to catch them at night with the aid of a lantern. *W. C.*

LARGELY INCREASED CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of 75 per cent.

Advertisers are also reminded that the "Chronicle" circulates among all classes of gardeners and garden-lovers *at home, has a specially large foreign and colonial circulation, and is preserved for reference in all the principal Libraries.*

The Patent Silicate Manure for Early Potatos.

The striking effects our Silicate has produced on Tomatos are seen on POTATOS as regards their EARLY MATURITY.

Fordingbridge, Hants, *September* 2, 1892.

DEAR SIR,—I can speak of your Silicate in terms of unqualified praise. I tried it especially on two beds or plots of Myatt's Ashleaf Kidney Potatos, side by side with two beds not so treated, with the result of more than **25 per cent. increase in measure,** and although not one of the earliest varieties of Potatos, was able to dig good sized tubers **eight weeks after planting.** Some roots yielded as many as twenty-six tubers fit for table, scarcely any falling under twenty.

(Signed) G. PARBERY.

Prices in Sacks at Works:—10s. per Cwt.; £2 per ¼ Ton; £3 15s. per ½ Ton; £7 per Ton.

Testimonials.

"Shirburn Castle, January 5, 1890.

"SIR,—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACCLESFIELD."

"Hornby Castle, Lancaster, February, 1890.

"Major FOSTER has much pleasure in stating that the vineries and forcing-houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.

"Sir HENRY INGILBY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep it in repair."

THE IMPROVED GARDEN CULLY

(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1*s.* 6*d.*; 8-in., 2*s.*; 10-in., 3*s.*; 12-in., 6*s.* 6*d.* 15-in., 8*s.*

(*The larger sizes are very strong for carriage drives.*)

TO FLORISTS.—A young Man seeks re-engagement as SHOP ASSISTANT, or Manage Branch Business. Nine years' experience in Making-up, &c.—W. PINK, 53, St. George's Road, Brighton.

FLORISTS.—A young Lady desires re-engagement. Well up in all branches. First-class references. FLORIST, 14, Clarendon Road, West Green, Tottenham.

TO FLORISTS.—A young Lady wants situation as FLORIST'S ASSISTANT. Experienced; accustomed to serving behind Counter.—ROSE, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO FLORISTS.—A young Lady desires re-engagement in a Florist, Seed, or Fruit Business. Experienced in all branches. Good Saleswoman.—EMILY, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S OINTMENT and PILLS.—Rheumatism, Neuralgia.—It is sometimes difficult to determine which of these diseases is afflicting the sufferer, but this ignorance will not matter if Holloway's remedies be used. They alleviate and cure all muscular and nervous pains. In hereditary rheumatism, after bathing the affected parts with warm salt water, Holloway's Ointment should be well rubbed upon the spot, that it may penetrate and exert its soothing and regulating properties on the deeper vessels and nerves which are unduly excited, and cause both the pain and swelling. Holloway's treatment has the merit of removing the disease without debilitating the constitution, which was the inevitable result of the bleeding, mercury, and colchicum practices formerly adopted in these complaints.

You Must have the **BEST** Lawn Mower, and that is the Patent

EXCELSIOR LAWN MOWER

FOR HAND POWER.

THE PATENT

"EXCELSIOR."

THE SIMPLEST AND BEST LAWN MOWER FOR ALL REQUIREMENTS.

ALBERT BATH, Vine Court, Sevenoaks, Kent.

THE MOST SUITABLE FOR
SHADING ORCHIDS, FERNS,
Palms, and Stove and GREENHOUSE PLANTS.

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.

WILLIAMS' HOTHOUSE SHADING.

It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. The leading Orchid and Plant Growers in the country have used this material for some years, and speak very highly of it, pronouncing it to be the very best material for Plants they have ever used.

Blinds made up and fixed complete.

Sold in pieces, 30 yards long by 1½ yard wide. Price 40*s.* each. Samples submitted gratis.

B. S. WILLIAMS & SON
Victoria and Paradise Nurseries,
UPPER HOLLOWAY, LONDON, N.

FLORISTS' FLOWERS, a Specialty.—My Superb Collections of Antirrhinums, Auriculas, Begonias, Carnations, Dahlias, Delphiniums, Fuchsias, Gaillardias, Pæonies, Pansies, Pelargoniums, Pentstemons, Petunias, Phloxes, Pinks, Potentillas, Pyrethrums, Violas, Hardy Border and Herbaceous Plants, &c., are the grandest ever brought together. They have been awarded numerous Certificates and Gold, Silver, and Bronze Medals, by the leading Horticultural Societies in the kingdom, with emphatic eulogiums by the Press, and my Illustrated Catalogue of them for 1893, 134 pages, which should be carefully perused by all before ordering elsewhere, is the largest, most comprehensive, and most reliable ever issued on Florists' Flowers and Hardy Plants. It has been posted to my Patrons, who will please oblige by informing me if any have miscarried, when I shall be happy to post another copy, free on application.
JOHN FORBES, Hawick, Scotland.

NATIVE GUANO.—BEST AND CHEAPEST MANURE for GARDEN USE. Price £3 10*s.* per ton, in bags. Lots under 10 cwt., 4*s.* per cwt.; 1 cwt., Sample Bag, sent Carriage Paid to any Station in England, on receipt of P. O. for 5*s.*

Extracts from 16th Annual Collection of Reports:—

NATIVE GUANO, FOR POTATOS, VEGETABLES, &c.

H. BRINKWORTH, Potato Grower, Reading, used for Potatos, Onions, and Carrots, results:—"Very good; never had better crops."——J. BUTLER, Sittingbourne:—"Used for Potato, Celery, and other Market Garden Crops, with very good results; Potatos large, clean, and free from disease. Best and Cheapest Manure in the Market."

NATIVE GUANO, FOR FRUIT, ROSES, TOMATOS, &c.

J. PEED & SONS, Streatham, used for Fruit Trees and Roses, results:—"Very satisfactory; we use no other Guano now; consider yours preferable to Peruvian."——J. FINCH, Orrell Gardens:—"Used for Vegetables, Tomatos, Grapes, Cucumbers, and Flowers, with satisfactory results. Most excellent for Potatos, and many other things. The Cheapest Manure in the Market."

Beware of imitations.

The Patent Silicate Manure for Early Potatos.

The striking effects our Silicate has produced on Tomatos are seen on POTATOS as regards their **EARLY MATURITY.**

Fordingbridge, Hants, *September* 2, 1892.

DEAR SIR,—I can speak of your Silicate in terms of unqualified praise. I tried it especially on two beds or plots of Myatt's Ashleaf Kidney Potatos, side by side with two beds not so treated, with the result of more than 25 per cent. increase in measure, and although not one of the earliest varieties of Potatos, was able to dig good sized tubers eight weeks after planting. Some roots yielded as many as twenty-six tubers fit for table, scarcely any falling under twenty.

(Signed) G. PARBERY.

B. S. WILLIAMS & SON

Victoria and Paradise Nurseries,

UPPER HOLLOWAY, LONDON, N.

WEBBS' NEW FLOWERS

WEBBS' NEW IMPERIAL CANTERBURY BELL.—A new and splendid selection of this garden favourite. The plants are of neat pyramidal growth, and abundantly furnished with a variety of brightly-coloured flowers. **6d.** per packet, post-free.

WEBBS' NEW DWARF BLUE CORNFLOWER.—A dwarf and compact-growing variety, the plants rarely exceeding 9 inches in height, and bearing, in great abundance, beautiful flowers of the richest blue. **1s.** per packet, post-free.

WEBBS' New Hybrid DELPHINIUM.—The plants of this magnificent strain are valuable for planting in the hardy herbaceous border, or in shrubberies. When established, the spikes of bloom attain a height of from 3 to 4 feet, and are covered with flowers of all shades of colour, from white to the darkest blue. **1s.** per packet, post-free.

WEBBS' NEW GODETIA—"WHITE PEARL."—A valuable variety which, on account of its dwarf and neat habit of growth, is very useful for small beds or ribbon-gardening. It produces its pure white flowers abundantly throughout the season. **1s.** per packet, post-free.

WEBBS' NEW NASTURTIUM—"METEOR."—A free-flowering variety, growing about 9 inches in height, and forming dense bushes, which are covered with blooms of brilliant scarlet colour. **6d.** per packet, post-free.

WEBBS' NEW TIGER ZINNIA.—A remarkably interesting class, growing 18 inches high, and producing large double flowers, which are striped more or less with brilliant colours in a most fantastic manner. **1s.** per packet, post-free.

WEBBS, WORDSLEY, STOURBRIDGE.

THE FOUR BEST TOMATOS.

Each Packet contains about 150 Seeds.

Perfection, 3d.; Conference, 3d.; Hackwood Park Prolific, 3d.; Challenger, 4d. The Collection, post free, 1s. 2d.

"Two Threepenny packets of my Tomato seed produced 2100 lb. of fruit last season, at Dartford.

THE SIX BEST PEAS.

William Hurst, 1s. 6d.; Duke of Albany, 1s. 6d.; Sharpe's Queen, 1s. 6d.; Prince of Wales, 1s.; Veitch's Perfection, 1s.; Ne Plus Ultra, 1s. All per quart. Best Selected Stocks. The Collection, 8s. 6d., carriage paid; half quantity, 4s. 6d.

THE FOUR BEST CELERIES.

Each packet contains ½ oz. of Seeds,

Standard Bearer, 3d.; Major Clarke's or Leicester Red, 3d.; Biddy's Defiance, 3d.; White Gem, 4d.

The Collection, post free, 1s. 2d.

NEAL'S NE PLUS ULTRA RUNNER BEANS.

The best of all Runners. Often sold under various other names to get fancy prices. 1s. 4d. per quart; postage, 4½d. extra.

THE FOUR BEST CUCUMBERS.

Each Packet contains 10 Seeds.

Lockie's Perfection, Rollisson's Selected Telegraph, Epicurean, and Tender and True, 6d. each; or the Collection, 2s., post-free.

FLOWER SEEDS, all best Selected Strains, and considering the Size of Packets and Quality, are about two-thirds to half what are usually charged.

GARDENERS will study their Employers' interest, as well as their own, by giving Mr. Sydenham's Seeds a Trial.

SATURDAY, MARCH 18, 1893.

THE FIRST FLUSH OF SPRING.

I AM not about to be poetical, in fact, I could not be were I ever so well inclined, and so I leave the Primroses and Violets, and Larch buds and Hazel blooms, and all that sort of thing to others, and enter on that which is more to my taste (alas! poor one), that which is practical, and which comes to me in the corners of my own little garden, for my garden is small, and as my taste for flowers is enormous, I find it hard to accommodate all that I wish to have; and as my pride is in somewhat the same predicament, I am obliged, like little ships, to keep near shore. I grow no collections of anything, the Rose man, the Daffodil man, the alpine man, and all those whose minds are set upon one particular flower, would be very much disappointed, I fancy, with my garden. What a little place to make such a fuss about! Yes, it is so; and I am open to the indictment, but with all that I have a garden, in which at all times the lovers of flowers may find something to interest them. I have no space for effects. I cannot group in masses, I cannot dazzle with a sheet of brilliant colouring, and yet the other day a lady and gentleman riding past, and attracted by a lot of colouring in the drive leading up to my house, rode on, and said it was the prettiest piece of colouring they had seen for some time. Well, what was it? this desire when I first came here a quarter of a century ago, was a trouble to me. I did not know what to do with it. There was at the back a shrubbery of a very mixed character, while the border in front contained all sorts of evergreens. Though high and low plants and shrubs, &c., I could do nothing with it, so I turned it into a rough rockery; and in this I planted various things, which I hoped were suited to the place. Amongst other things were a few bulbs of Cyclamen Coum and Atkinsii, and this place seemed to suit them admirably. In summer the soil is literally baked if it be a hot one, but there is a partial shade from the overhanging trees, and this they have made their home to their complete enjoyment; they have seeded all over the place, and their forms of flowering and variations of colour make them most pleasing. And then long before any species of Snowdrop that I have is in flower, these display their charming flowers. Coupled with these was a good clump of the Winter Aconite, and some clumps of the common Snowdrop, and also Galanthus Elwesii. With regard to the Aconite, I should like to ask a question. I planted two pieces of it, one has spread all over the neighbouring piece of ground, while the other has not spread at all, though the clump has increased in size, but has not spread. Are there two varieties of it? or is this only an accidental variation? Although this parterre was only about 3 yards

*

by one yard, yet it afforded a delightful bed of colour, and was one of those things that give one the first flush of spring.

At the end of this rockery I have a nice little batch of Anemone blanda, kindly sent to me by Mr. Whittle. It is well known how very much this species varies in colour, and these were sent to me with the character of being darker than the type. I think they are darker than many which I have grown, although I fancy some from other quarters are nearly as dark. There is hardly any sweeter harbinger of spring than this lovely alpine, and it is so easily grown that everybody ought to have it. It will grow in the border as well as on the rockery, and wherever it is, its delicate colouring and neat foliage make its welcome.

Of course one must not omit the Crocus among the flowers that contribute to give us the first flush of spring, and this season they have been peculiarly beautiful. My borders are edged with the large yellow. The wet weather that we had must have contributed to their well-being, for they have not been for years so good. The mice have not eaten the roots, nor the sparrows picked the flowers to pieces, as is their wont; but I think some clumps of the species on the rockery have given me as much pleasure. The delicate pusillus, white and blue; Aucheri, yellow, with brown on the back of the petals; dalmaticus, and this I have with the added name of violaceus, but I see nothing of its colour, as it is pure white, so that I am afraid I have not got it correct; ochroleucus, a bright yellow; but I think there is nothing for brilliancy to equal the garden variety, Cloth of Gold, a rich brilliant golden-yellow, with a delightful tinge of orange in it which adds greatly to its beauty; the Hepaticas, with which in previous years I have had some difficulty, seemed to have rejoiced in the abundance of moisture which we have had. The varieties of Hepatica have done well, and so have all the patches of angulosa, which are very charming. The delightful little Saxifraga, S. Burseriana, has very early shown its great beauty, smothering the plant pretty well with its pure white flowers. The first flush of spring, too, has come to the shrubbery; here in my border is a delighful plant of the white variety of Daphne Mezereum, not only pure and beautiful, but shedding a most delicious fragrance all round. I think that if I had more space I should go in much for the many beautiful flowering shrubs now within our reach; but as it is, I must be content with the very few that I have space for.

Daffodils, too, are putting in their claims to keeping as in the first flush of spring; the paddock in front of my house is studded over with clumps of the old Lent Lily, to which I have of late added some of the Trumpet varieties—they are not yet in flower; but as one watches their fat flower-buds, we anticipate what a golden beauty we shall have to look upon shortly. Nor is this all: on the rockery I see that N. minor is in full flower, and that quaint little member of the family, N. cyclamineus has one or two flowers open.

Although in our woods Primroses have been gathered in abundance, I do not find that the garden varieties are amongst the earliest harbingers of spring; they are all more or less showy blooms, and are now gay enough. One that I had some years ago from my friend, Mr. Hammond, of St. Alban's Court, under the name of lilacina, is in flower, and so also the species P. cashmiriana; but I have been careful to confine my notice to those flowers which open here in February, and thus cheer us after the long dreary time of winter. We welcome them gladly, and perhaps the more so when we know, as I do, that I cannot many more times do so; and as I look upon them in their fading beauty, I feel that they are an indication that the time is passing away, and that for once more I must bid good-bye to these charming little gems, which many overlook, but which to me are not only valuable for their intrinsic beauty, but because they continue to cheer one by giving us the "first flush of spring." *Wild Rose. February.*

New or Noteworthy Plants.

ODONTOGLOSSUM LANCEANS, *Rchb. f., var.* GRAVESIANUM. *New var.*

A five-branched panicle of over forty flowers from Messrs. F. Sander & Co., comes as a hybrid out of their superb strain of O. crispum, and distinct though it is, it must be regarded as coming under the varied series classed by the late Professor Reichenbach as O. lanceans. The variety Gravesianum is nearer perhaps to that known as "Jenningsianum." The sepals and petals are creamy-white, profusely spotted on the basal halves with small reddish-purple marks, those on the petals being smaller than those on the sepals. The long narrow lip has some resemblance to that of O. cirrosum in the rounded toothed side-lobes. The crest has two pointed teeth in front, and lesser ones at the base. The column is white, brownish-red on the under side; the lip yellowish-white, with one blotch and several smaller ones of a red colour in the centre. *James O'Brien.*

Dendrobium nobile Ballianum, *new var.*

A beautiful form of Dendrobium nobile has recently flowered from amongst an importation of D. nobile at Messrs. Sander & Co.'s, and to which the above name is given by desire. The flower is of fine form and wax-like substance, and its chief peculiarity is, that the more or less dark purple disc seen in the lip of the type, and the purplish colour in the segments of many of the forms, are almost entirely suppressed. The flowers of D. n. Ballianum are of a clear shining white, with a pale pearly-pink blush, which is more pronounced towards the tips of the petals, sepals, and lip. The disc of the labellum is of a very pale soft dull rose-pink, the front pale primrose, and the apex blush-pink, and differs from any form of D. nobile imported. *J. O'B.*

Calanthe vestita *var.* Cornelius Vanderbilt.

Here we have a splendid variety of this old and well-known plant, differing from the type in its stouter habit and the luxuriance of the flower, which surpasses by far the typical form; the red blotch at the base of the lip is decidedly larger and more radiant and vivid, otherwise there is no difference.

In spite of all resemblance to the imported genuine wild specimens, we have before us a merely artificial plant, a hybrid obtained by fertilising C. vestita rubra oculata with the pollen of C. Veitchii. It was raised by Mr. R. Gardner, head gardener to Cornelius Vanderbilt, Esq., Newport, Rhode Island, U.S.A., who has given us an accurate account of the origin of the plant.

It is a fact that the hybrid has reverted to one of its parents, and perhaps we may derive from this very plant a valuable hint for future guidance. As a rule, we can say that the influence of the pollen-parent is the more potential, and that its characteristics prevail in the hybrid; but in this case the influence of the pollen parent (i.e., C. Veitchii) is evidently overwhelmed by that of the female parent, and at first sight the rule seems to be broken; but remembering that C. Veitchii itself is a garden hybrid between C. vestita var. rubro oculata ("that variety of the white C. vestita which has a deep purple blotch at the base of the lip." *Bot. Mag.*, t. 5375), and C. rosea (then Limatodes rosea, Lindl.), we have in our plant twice C. vestita rubra oculata (male and female), and Limatodes rosea once, and only as female plant.

Considering the genesis of our plant, another form but C. vestita could not be expected, probably more vigorous and splendid than the wild type, in consequence of its hybrid origin, but resembling the typical form in every respect.

Rules of general value can only be derived from a great number of typical cases, but we admit that crossing hybrids with one of its parents, or hybrids with hybrids of similar origin, the new plant in all appearances reverts back into the species represented in both parents, that the influence of the other hybrid parents will be annihilated—in one word, that the new hybrid cannot be a new plant with a new combination of the character of both parents, but only a reiteration of the most prevalent ones. *Dr. F. Kränzlin, Berlin.*

Pholidota Lugardi

was sent by Captain Lugard to Sir John Kirk, of Wavertree, Sevenoaks, Kent, from the Chin Hills, Western Burma, where it is found at 6000 to 8000 feet elevation. It flowers in June. It is allied to P. articulata, Lindl., but is more robust, erect, and larger in all its parts (p. 6).

Epidendrum (Barkeria) Palmeri.

Is a very distinct Epidendrum belonging to the section Barkeria, collected by Mr. Edward Palmer, at Colima, Mexico, in 1891. It is characterised by its narrow leaves, small bracts, and numerous flowers, with papillose nerves to the lip. It is described from dried specimens (p. 6).

Saccochilus muscosus.

This species was sent from the Andaman Islands, together with Phalænopsis tetraspis, by E. H. Man, Esq. It has dull yellow flowers spotted with red-brown, and a white lip with a few small purple spots round the mouth of the spur. It flowered in the Kew collection during last November (p. 7).

Pelexia maculata.

This distinct species is believed to have been introduced by Messrs. Hugh Low & Co., but its habitat is not recorded. Its leaves are olive-green, blotched with whitish-green on the upper surface, and dull purplish-green below. The flowers are pale dull green, the sepals and petals tipped with pink, and the lip white. It flowered in the Glasnevin Botanic Garden, under the care of Mr. F. W. Moore, in July last (p. 7.) [The preceding four paragraphs are taken from the *Kew Bulletin.*]

Orchid Notes and Gleanings.

CYPRIPEDIUM "MOENS."

M. L. Linden gives the name Cypripedium × memoria Moensii to this variety, but it may be more convenient for garden purposes to use the simpler form we here propose. Whatever name be given to it, there is no doubt that this new hybrid is amply worth the attention of the connoisseur. The dorsal sepal is suborbicular, with the base stalk-like, from the reversion of the margins. The colour is a rich claret hue, bordered with white. The petals are of like tint, spotted at the base, and finely ciliated at the margins, with a median line of dark brown. The lip is shining brown, flushed with rose; staminode rose-coloured. It is figured in the *Lindenia*, t. 361.

Cypripedium Lucienianum ×.

A hybrid, as it is alleged, between C. villosum and C. bellatulum. The dorsal sepal is very large, white, heavily blotched, and spotted with purple, as in C. Boxalli var. atro-purpureum. The petals oblong-obovate, deflexed, reddish, with white margins; lip, reddish shining. *Lindenia*, t. 362.

Coelogyne Hookeriana.

One of the Pleione section, discovered by Sir Joseph Hooker in the Sikkim Himalayas, at an elevation of 7000 to 10,000 feet. The flowers are of a rich rosy-lilac colour. *Lindenia*, t. 363.

Mormodes igneum var. maculatum.

Differs from the type in the rich spotting of the sepals and petals, and there is a little difference in the ground colour. It was introduced from Peru by l'Horticulture Internationale. *Lindenia*, t. 364.

FERNERY AT MR. MAY'S NURSERY, EDMONTON.

The accompanying engraving (fig. 45), represents a Fern corridor, about 150 feet long, and barely 10 feet wide. It will be seen that species of Nephrolepis, and other drooping kinds, are suspended in pots and baskets from the roof, which make a complete furnishing, whilst upon the stages are well-grown, sturdy plants of various genera, that enjoy a cool, or slightly intermediate temperature, and are specially adaptable for purposes of decoration. The corridor forms one of the most pleasing features at the Edmonton establishment.

Fig. 45.—Fern corridor at Mr. May's Nursery, Edmonton.

THE HARDY FERNERY.

The period of winter rest for hardy Ferns has now drawn so far to its close, that the roots are commencing actively to prepare for the new spring growth, and in sheltered situations the crowns themselves may be observed swelling and fattening up with distinct promise of a proximate upheaval of feathery verdure. It is, therefore, the best time to take in hand any shifting, division, or repotting which may be requisite, the active state of the roots and absence of tender and easily-damaged frondage enabling them at once speedily to establish themselves after removal, and at the same time obviating the risk of spoiling the appearance of the plants for possibly the entire season.

In out-of-door rockeries which are in any degree exposed to drying winds, care must be taken when removing the old fronds not to leave the crowns altogether unprotected. When the new fronds begin to lift, there issues from the base of each a little tuft of roots, damage to which by drought or otherwise seriously checks or even stops altogether the development of the fronds they spring from; hence a light mulching of leaf-mould or *débris* of the old fronds themselves is beneficial as affording at once both protection and nutrition. Where, as in some of the evergreen Ferns, the fronds are persistent, they should not be cut off until they turn brown and shrivel, otherwise the new growth is apt to be checked, some parts of the vitality of the crown being certainly contributed by the old fronds so long as they retain their greenness. The deciduous ones, of course, require no such consideration, the old fronds being absolutely dead and rotted, and in this they possess the same advantage as deciduous trees, viz., an entirely fresh and new growth in the spring, unmixed with the shabby remains of a previous season.

For the reasons above given, the present is a capital time for the establishment of new rockeries or hardy ferneries generally, especially as at this season they lend themselves so freely to division. The Buckler and Shield Ferns (Lastreas and Polystichums), and the Lady Fern (Athyrium filix-fœmina) in nearly all their manifold varietal forms, propagate themselves freely by forming side divisions, or in some cases by bulbils upon their fronds. If it be desired to remove the former, it is well to take up the entire plant, when by shaking out the soil, the point of attachment of the various crowns can be easily seen and severed if need be, though generally they can be pulled or forced apart by a blunt knife, each then retaining its own roots, and forming at once a decent specimen of its kind. If the plants be small offsets, an ivory or bone knife will detach them easily, prizing them off rather than cutting them. If very choice varieties be in question, it is well to pot them in good compost, and give them a little frame protection until they start. At this late time of the winter it will do them no harm to give a little warmth, thus bringing them into decorative use a month or six weeks earlier than would normally be the case. The stimulus must, however, be moderate, or weakness will result. *C. T. Druery.*

LIFTING CAMELLIAS.

The planting-out of the Camellia in borders is a common practice, but the lifting of them when signs of ill-health become noticeable, is not so common. Some twenty years ago I planted two beds with five plants in each, one near each corner or facing the angle, and one in the centre, with the object in view that in time the centre one would fill the whole space, and as these plants grew in size, the others on the side nearest to it, were cut back till it became necessary to decide on either cutting them down or lifting them, and the latter course was decided upon. The plants were lifted in the spring of last year and with successful results. These plants were about 9 feet high, and from 6 to 7 feet in diameter, and they were carefully potted in loam, peat, and sand, with a plentiful supply of half-inch broken bones. The after-treatment consisted in their being kept dewed over several times a day, and shaded when the sun was bright. They soon afterwards began to make growth, and in the course of the season from 3 to 5 inches were made. The plants flowered freely this spring, not having, so far as I know, lost any flower-buds. The plants left in the two beds are C. fimbriata alba, 9 feet by 8; and C. alba plena, of the same height. Camellia flowers are not much the mode at present, excepting white varieties; but the other varieties, such as Auguste Delfosse, Bicolor de la Reine, C. H. Hovey, C. M. Hovey, eximia, Giardina Franchetti, Henri Favre, imbricata, Marchioness of Exeter, Mathotiana, Queen of Beauties, and Eugène Massima, which I consider is one of the most pleasing colours, viz., a soft shade of deep rose, shading off to a paler tint at the edges of the smooth evenly-imbricated petals. When fashion again changes, Camellias may come in once more. *A. Evans.*

THE HIPPEASTRUM.

I have frequently observed that the amateur cultivator of certain plants takes most interest in them when they are coming into flower, and at that time is eager for information concerning them. A few there are, who take a higher view of gardening than this, and who by careful study of plant life in all its stages of growth and of rest, find a never-ceasing round of enjoyment amongst their plants in spring, summer, autumn, and winter. Many amateurs, and I fear some practical gardeners, for want of knowledge, which they might easily obtain by studying the life history of any plants they are interested in, fail to cultivate them successfully, and go on in a haphazard way, when a little thought and forethought might have crowned their work with success. Take the Hippeastrum, for instance: I have seen many failures in its culture through nothing but gardeners failing to realise the fact, that the plants after flowering require very much more attention than they did before doing so. Not that they should lack attention at any time, but they need it most when in building up their bulbs and laying the foundation for flowering next season. The structure of the flower-scapes for 1894 will be laid in July and August of the present year. What I have had to complain of is this; plants when in flower are removed to the greenhouse or conservatory from the hothouse where they made their growth, and the flowers may last for two weeks or so; after they pass away the plant itself is thought little of, and is left in the greenhouse amongst the other plants as long as the leaves remain green, when the leaves decay, and become unsightly, the flower-pots containing the bulbs are pushed out of sight under the stage.

Now, I do not object to place even valuable varieties in the greenhouse when in flower, but as soon as the flowering period is over they are taken back to the hothouse again, and the flower-pots are plunged over the rims in spent tanner's bark; and with a gentle bottom-heat the roots find their way into the plunging material, and fairly revel in it, until growth is completed in August and September. The bulbs

were not re-potted this year until the middle of January and later; and as I write these lines the last week in February, the larger number of the scapes are well up, and the earliest blooms on the point of opening. One cannot but be interested in them at such a time, and the interest is greatly increased when seedlings of good parentage are expected to open their flowers for the first time.

The Hippeastrum is one of those plants which freely produce seed under favourable conditions, and the flowers are so very easily cross-fertilised that any amateur or gardener should be able to manage it. At this season, with the plants pushing up their flower-spikes, it may be useful to give a few details of culture. As I have already hinted, no care in culture now can compensate for neglect when the plants were maturing the bulbs; we may look in vain for the appearance of the flower-spikes now, if the plants lost their leaves early by neglect last year. If they have been well cared for, at least 95 per cent. of the full-sized bulbs will produce flowers, and it is pleasant to see them pushing out from the crown of the bulbs, one, two, and sometimes three spikes from each, for some of the best varieties in our collection have produced three spikes from one bulb, with an aggregate of seventeen flowers; it is rather curious, but I have seen six flowers on two of the spikes, and five on the other, but never six on each of the three. In the early stages of growth, great care must be taken in the application of water either to the leaves or roots of the plants, for some bulbs are very liable indeed to decay, either owing to moisture in the atmosphere, or water applied too soon to the soil after repotting, or too freely later. I repot the bulbs in fairly moist soil at the first, and they do not require any water at the roots for at least three weeks after repotting, and only after that time if they are really dry. If the temperature of the house is kept too high, the leaves will be drawn up, and the flower stems also; 55° as a minimum is a good temperature, and the house should not be kept too closely shut up. I like to admit air every day, even in dull cold weather. This causes the flowers to be rigid, and the leaves to stand up stiffly. When the flowers are developed, they may be placed in the greenhouse or conservatory, where they last very much longer than they do in the hothouse. They must in either case be shaded from bright sunshine, which soon causes the petals to drop. An examination of the bulbs when the flowers are fully expanded will show how exhausted they have become by the development of the leaves and flower scape; they would be less than half their size and weight, with the skin hanging loosely around them, whereas at the time of repotting, it would be tightly stretched over the outer coating, almost to bursting. All this has to be made up again during the few months in which growth can be made, and not only made up, but the bulbs should greatly increase in size up to what they can be grown under good cultivation.

There does not really seem to be any recognised standard of excellence for the Hippeastrum, as we have in the case of other garden flowers, such as the Tulip, the Dahlia, &c.; but all the successful raisers of new varieties go in one direction—in the line of large flowers, with broad, well-formed segments of good substance, forming a symmetrical flower. In this direction there is steady progress to note from year to year. The colours of the flowers are bright, almost sparkling in their brilliancy, and lovely in the softer shades of rose, blush, and pale colours arranged in stripes and flakes on white or cream-coloured grounds. An error may be made, and is made, in not ruthlessly destroying plants with a feeble constitution; some of them cannot be coaxed into growth sufficiently strong to give a flower-spike after they have been some years in cultivation.

If a weakly-constitutioned variety is retained in a collection because of the superior merit of its flowers in form or colour, it should not on any account be used as a seed-bearer. A weakly plant possessing flowers of unique colour, exquisite form, or some other quite novel peculiarity, may be used as a pollen-parent upon some vigorous-constitutioned variety, and in this way the novel features may be retained, and greater vigour thrown into the progeny. It is interesting and curious to observe the difference between the flowers, as we find them "improved" into one uniform shape by the hand of the gardener, and the great diversity of form and colour in natural species. As examples of flowers without tubes, but totally different in colour, we have H. pardinum and H. Leopoldii. Next, there is the parent of many garden varieties, H. Reginæ, with scarcely any tube, but entirely different in colour; H. reticulatum, the species with netted veined leaves, with a medium-sized tube, and quite different from any other in the leaf, as well as in the form and colour of its flowers. Again, we have in H. Raynerii (the blue! Hippeastrum), with pale purplish flowers spotted within, the large leaves sickle-shaped and edged with buff, in the growth of the plant and form of the flowers quite unlike any other. H. Solandriflorum, again, has flowers 10 inches long, it is also different in flower and leaf. All these might be crossed to obtain flowers in form and colour different from anything we now possess. The work would need to be done by an amateur who took more than a pecuniary interest in the business; at least, there could be no certainty that profit would be made, but science would undoubtedly gain by the experiment. *J. Douglas.*

Cultural Memoranda.

TACSONIA VANVOLXEMI.

Trained thinly over the roof of a warm conservatory, this handsome climber is a very graceful plant. It should be planted in positions where there is space to extend its shoots and sunlight to ripen the wood. It is better if the roots are somewhat confined in narrow borders or tubs, the plants flowering very freely when that is so. The finest specimens of this variety, and T. exoniensis×, that I ever met with were at Longford Castle, and these two were finely bloomed by the then and present gardener, Mr. H. W. Ward. Liquid manure was frequently and copiously supplied. The plant is easily propagated from cuttings taken with a heel, and about 3 inches in length, and placed in pots of sandy loamy soil in a brisk bottom-heat. The plant may also be raised from seed.

Bouvardias.

Bouvardias should not at any time be subjected to a too high temperature, and if they are to bloom in the winter, a night temperature of 55°, with a rise of 10°, or even a little higher, in the day will bring out their flowers perfectly. Shoots fit for making cuttings are easily found on plants that have been kept in warmth during the winter, and these should be taken off with a heel whenever possible, although they will root without one whilst the wood is still immature. If put into small cutting-pots in the ordinary manner, and plunged in a hotbed with a brisk bottom-heat, rooting soon takes place. The rooted cuttings should be potted-off in small pots in a light sandy soil warmed to the temperature of the bed, and when rooted into the soil and making good headway, the leading shoot, and afterwards the resulting lateral shoots, should have the points pinched out to cause bushiness of habit. Young plants should not be over-potted. Cramping the roots in pots too small for them is better than this, and a good useful specimen may be had in a 48 or a 32. Rather more loam than previously may be used at the last potting, and generally, a stronger soil should be used, than if small pots are employed.

In July they may be stood in a cold frame, standing the plants sufficiently far apart to prevent overcrowding, giving plenty of air daily, and dewing them overhead each afternoon. The old cut-back plants should be kept close and shaded for a few days, and when they begin to break freely may be partly shaken out of the soil and put into smaller pots, shifting them on as occasion requires, but keeping them close for a time after cutting back. Towards the end of September, the new and old stock should be placed in the greenhouse, and taken to warmer quarters in batches, to hasten flowering, as required. Alfred Neuner is a good double white, and an excellent variety; President Garfield, a beautiful salmon-pink, double-flowered; Vreelandi, white; The Bride, white, blush-tinted; President Cleveland, scarlet, and very free-flowering; Hogarth, Leiantha, and many others.

Bougainvilleas.

These plants, to flower them well, should be pruned somewhat severely every year at this date, or in the case of cutting unusually hard back, in the autumn, and they should be kept moderately dry at the roots till growth recommences, when copious waterings will be necessary. The plants are propagated from cuttings of the young shoots about 3 inches in length, taken with a heel of old wood, and put into small pots containing sandy soil, watered, and when dried somewhat, plunged in bottom-heat of 80° in a close frame. Rooting soon takes place, and when a good number of roots are made, the plants should then be potted, re-potting them when the roots have filled the pots. Whilst growing into specimens a lighter soil should be used than that finally employed for the flowering-pot, or when planting in a border. A sprinkling of bone-meal or Thomson's Vine Manure mixed with the soil, maintains the vigour of the plant, and without strong well-ripened wood, the new shoots are likely to be spindly to produce fine clusters of flowers. *H. Markham.*

SEASONABLE WORK.

The felling of heavy timber and thinning of plantations had better be finished as far as possible before the trees are loaded with sap, and the buds and leaves begin to expand; and as spring is the best time of the year for seasoning all sorts of timber, the different kinds that may be wanted for estate and other purposes should be cut up into boarding, planking, and scantlings of different shapes and sizes, according to demand, and the stuff placed under cover in an open, airy shed, to be seasoned. As insect pests are now beginning to be on the move, and as many of them use trees on the decline for breeding purposes, such trees had better be cut down at once and removed from the plantations; but in cases where the trees cannot be removed at present owing to the press of other urgent spring work, they may be left for the present on the plantation roads; but in all cases Pine trees in particular should have the bark removed to prevent the Pine-beetle and Pine-weevil from using them, as it is always between the wood and bark where these insects deposit their eggs. In places where these insects are plentiful, it is also advisable to scarify the stumps of recently-felled Pine trees, as the weevil (Curculia pini) deposits its eggs in groups at the angular corners of the larger size of surface roots; while the beetle (Hylurgus piniperda) excavates a subcortical tunnel generally along the trunk, and deposits an egg here and there on both sides of the burrow as the work proceeds. This explains the necessity of peeling off the bark to keep these pests within due bounds. In the natural forest, branches and rubbish of all sorts should be collected into heaps on open spaces here and there, and burned; the ashes should then be spread out on the surface, and a mixture of hardy grass-seeds sown on the spot, which, in due course, will afford a welcome bit of grass for the deer and sheep. The best grasses for this purpose, is a mixture of the hardy Fescues, as well as Cocksfoot grass (Dactylis glomerata), and Hair-grass (Aira cæspitosa), both of which form large round-headed tufts, makes excel-

lent covert, and affords a cosy retreat for game to hatch their young under their canopy of pendent foliage. Some plantations are overrun with squirrels, which gnaw and peel the leaders of coniferous trees, but in shooting them, care should be taken not to smash the top of the trees with the shot. Trees that are badly infested with the caterpillar of the Goat-moth (Cossus ligniperda), as well as such as are infested with the caterpillar of the woods, Leopard-moth (Zeuzera æsculi), which may be known by the sawdust-like stuff which they excavate from their burrows, and can be seen resting in the chinks of the bark of the stem as well as on the ground at the base of the stem. As trees of this kind are doomed to make little further progress, and as the wood is of little value, they had better be cut down at once, and either committed to the flames on the spot, or used as firewood elsewhere, with the view of lessening the numbers of the pest, and keeping them within bounds. The short-tailed field-mice (Arvicola agrestis) sometimes does much damage to young coniferous trees, as well as hard-wood trees, by eating the bark around the base of the stem, as well as the surface-roots, but by dressing the wounds with Stockholm tar they generally shift their quarters, and the trees are saved. They are very prolific, and breed from three to six times during a year, and produce from four to eight at a birth. When the woods are well stocked with night-owls, they keep down the numbers of the mice and lessen the risk of damage. If not already done, standard and other trees that have had their tops ruptured by wind during winter, should have their wounds dressed by paring off all splintered wood down to the solid timber and the surface of the wood dressed with a coat of thick paint, the same colour as the bark of the tree, to prevent the ingress of water, and the growth of fungus-spores. Old dilapidated trees that have

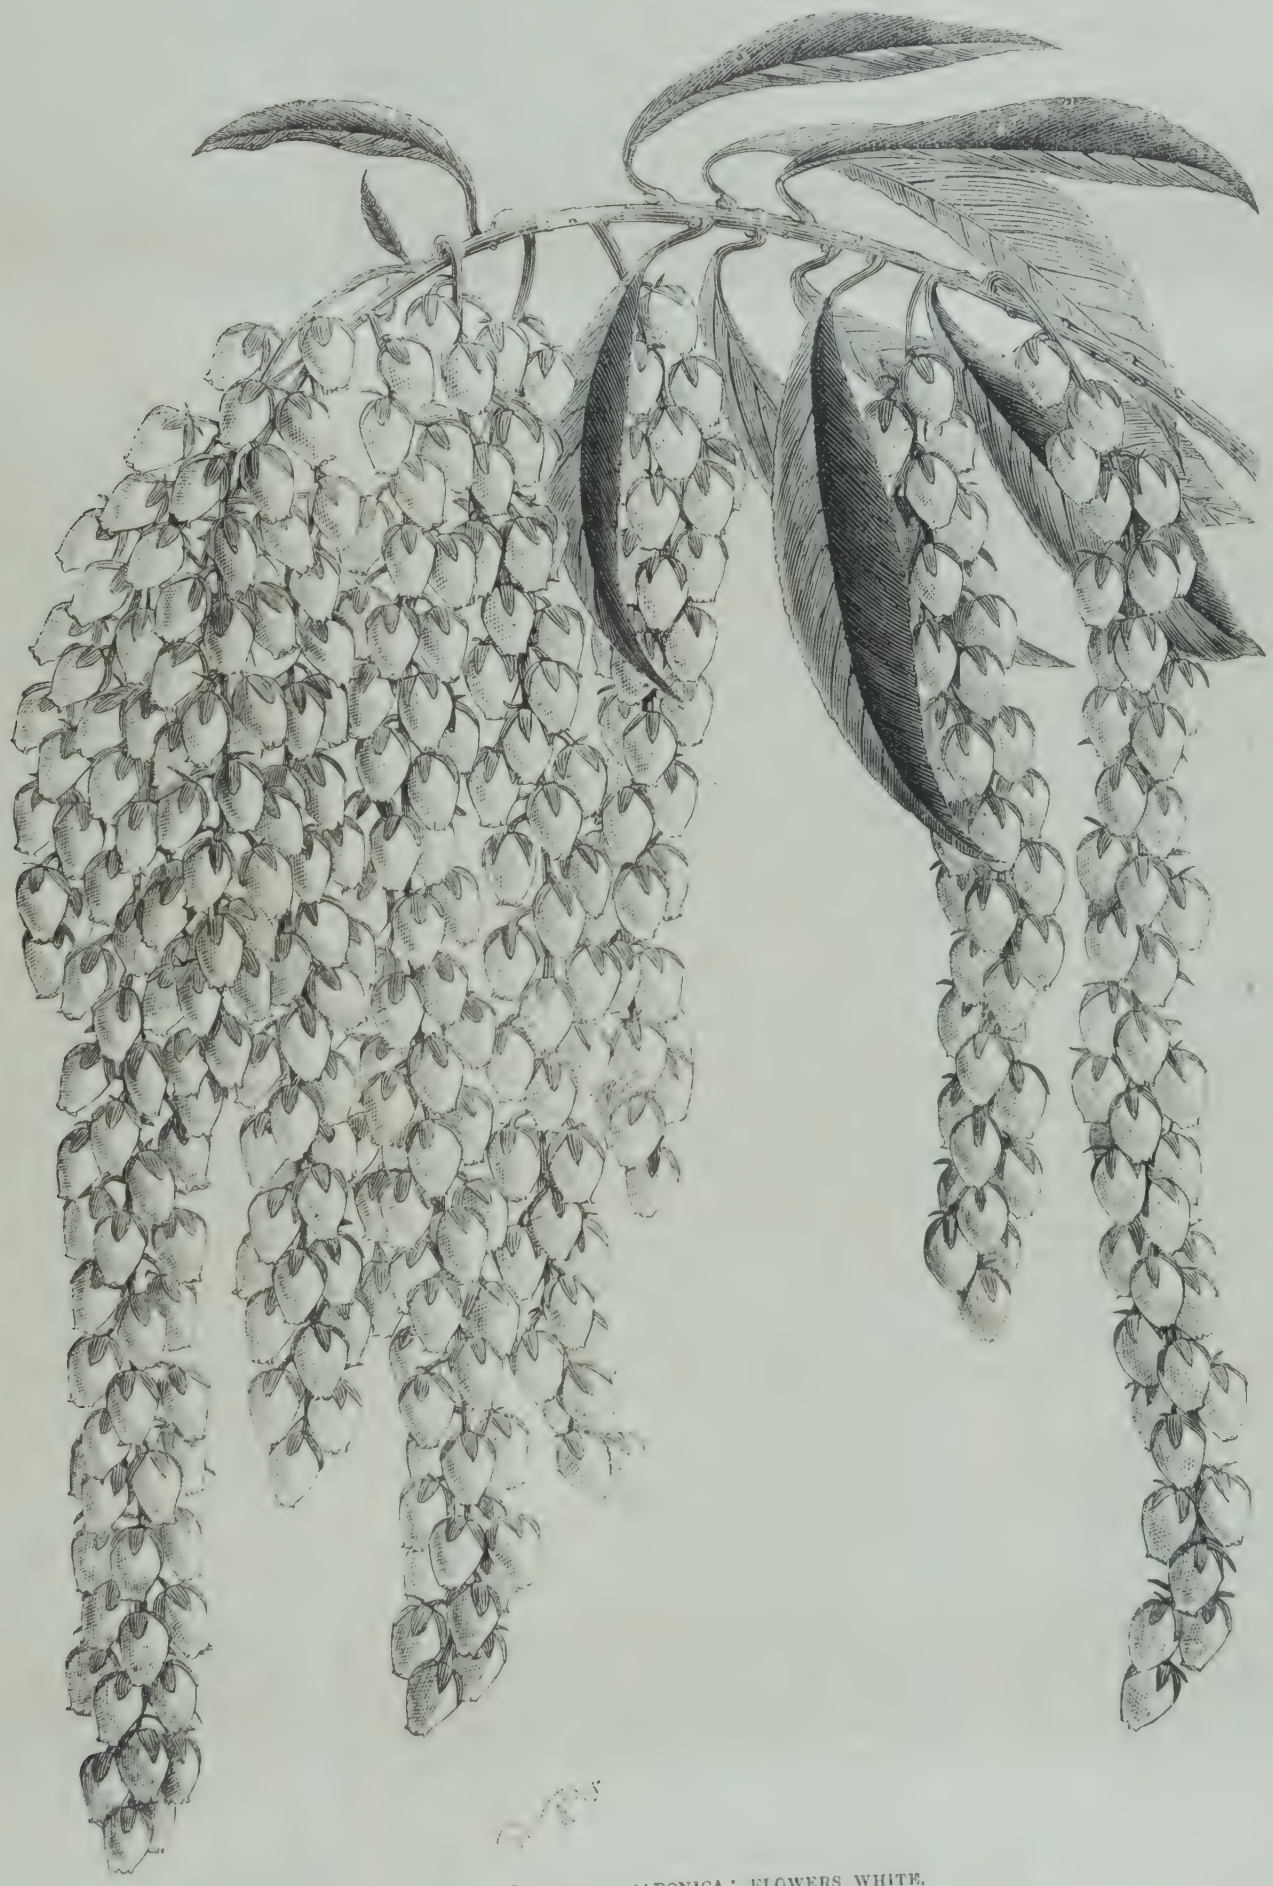

Fig. 46.—Pieris japonica: flowers white.

(See "Floral Committee," in Royal Horticultural Society's Report, p. 335.)

a history should likewise be examined, and all dead and rotten wood removed, and the wounds dressed in the best way that the circumstances of the case may suggest to arrest decay. I may, however, remark that in cases where rotten holes or pockets occur in the trunk, these should be cleaned out, and the place filled up with concrete to prevent the lodgment of water, insects, and fungus spores.

Planting.

The planting of forest and ornamental trees should be finished, if possible, before the buds and leaves begin to expand; but owing to the antiseptic properties of peat-soil, coniferous trees generally give the best results when planted on such a soil in the month of April, as the roots never lie for any length of time in the cold bog until they begin to grow. Standard trees of recent introduction should be examined, and any of them that are showing signs of distress should have a proper restorative applied at once. In cases where the soil has become exhausted, or of a poor thin nature, a top-dressing of well-decomposed farmyard manure will prove beneficial to both hardwooded and coniferous trees, and cannot be too soon applied. Young trees that are pushing up several leaders at the top should have the weakest cut back, or cut off altogether; but trees that are known to bleed after pruning had better be left alone till early autumn. Young trees that were planted in autumn and during winter should be looked over, and any of them that are blown to one side should be set up, and a little fresh soil added, and made firm with the foot. Collars or ligatures that have been placed around the stems of trees at the time of staking and tying, to keep them in position, should be examined, to see that they are not too tight and cutting the bark, and if so, loosen them a little, to allow the stem space to expand during the growing season. Amateurs when planting their gardens and grounds at suburban villas, should take care not to plant trees that will ultimately attain a large size in proximity to their houses, as in course of time their shade will obscure the light to a large extent, give the place a dark gloomy appearance, and, besides, it is objectionable from a sanitary point of view. In planting the trees, break up the soil thoroughly with a pick, and spread out the roots to their full length without crossing each other; cover them with a little fine soil of a loose open texture, and finish by placing the ordinary soil on the top, and making it firm with the foot. Deep planting is not to be commended; the roots should not be deeper than they had previously been when in the nursery. Tying and staking should be attended to when necessary, and in many cases a mulching will prove highly beneficial. *J. B. Webster, Fairview, Stangmore, Dungannon.*

The Week's Work.

FRUITS UNDER GLASS.

By M. Temple, *Carron House, Stirlingshire.*

FRUITING PINES.—Plants on which are ripening fruit should be kept dry at the roots, and syringing entirely dispensed with. Those fruits which are now swelling rapidly will require copious supplies of water. The large amount of sun-heat, and artificial heat by night, will demand closer attention being paid to keeping the pinery moist as well as the soil, especially if the houses are spacious, sprinkling all surfaces several times a day. Shut up the house early in the afternoon, allowing the temperature to rise to 80° to 85°, and permitting the heat to fall to 70° during night. If fruits are coming up, let those plants be kept dry overhead till flowering is past, and afford liquid manure to all well-rooted plants. Peruvian guano is safe manure to use, but it should not be stronger than to slightly colour the water, and this when given often, and weak in preference to stronger applications at longer periods. Uncertain mixtures of liquid manure from the farm and stable yard often do much harm to plants in pots.

SUCCESSION PLANTS.—Recently-potted plants if placed near the glass may require slight shading during the middle of the day, especially if the weather has been dull for some time. Healthy plants should be kept freely growing, and fresh air daily admitted to them to sweeten the house and strengthen growth. Those which are to supply fruit during the early autumn should be kept somewhat dry at the roots, and have all the light that is possible. Queens suit well for this purpose. The night temperature may fall to 65°, or still lower if weather should be dull and cold. If any plants show signs of bad health—as those which have had too much water with absence of bottom-heat during the winter months always do—clear off the roots from the soil, cutting away the base of the roots if decayed, and removing some of the drooping bottom leaves to allow of the emission of fresh roots, and repot in clean well-drained pots, using clean turfy loam, some finely broken charcoal, with a small handful of bonemeal, and the same of soot, if the pot be a 10-inch one. Plunge the plants in a bottom-heat of about 90°, keeping the atmosphere somewhat moist, at a temperature of 75°, or 10° higher with sunheat, till growth becomes active, then ventilate more freely. Treat suckers in a similar way when newly potted, but with an average of 5° lower temperature, and the use of shading if the sun should be bright. Get a good store of loam placed in dry quarters for use next season.

VINES.—Attend closely to former directions, airing early, moistening all surfaces in the vinery freely, and utilising sunheat, which may not rise higher than 85°, allowing a fall to 70° at night, or in severe weather to 65°.

SUCCESSION-HOUSES.—In northern and cold districts especially, all late Vines should now be moving; as those which are to be kept late should have their crop well ripened in September. It is false economy to use fire-heat late in the season when the work of ripening might be finished weeks earlier. With bright sun the Vines now breaking should be freely syringed, allowing the sunheat to raise the warmth at closing time to 75°; the night temperature being kept at 50° to 55°, according as the weather is cold or the reverse.

PEACHES AND NECTARINES, which are swelling their fruit, may have a gradual thinning, allowing the fruit to stand clear of each other. The temperatures till stoning is past should not exceed 60° to 65° at night, and 10° higher with sun.

LATE HOUSES should move slowly. Strawberries must have plenty of air when setting and ripening. Successions may be brought on in frames, they then force readily.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

PALMS.—Amongst the so-called decorative Palms, Kentia Fosteriana and K. Belmoreana keep in good condition in pots longer than all others, and they are quickly brought round again when out of condition. Both are the more useful when growing in 4 and 6-inch pots, they being very suitable for a variety of purposes, in table decoration, filling vases, &c.; whereas those which are grown in 8 and 10-inch pots are good for general decoration. These and other species of Palms which may have been in use a great deal during the past autumn and winter, should have the drainage of the pots put into good condition; repotting may not always be necessary every year. The two species mentioned at the beginning of this article keep the colour of their leaves in the greenhouse or conservatory in the ordinary way, but if the plants are exposed suddenly to frosty air, or even to cold not so low as the freezing-point, say in moving them from place to place, they will turn of a yellow tinge, but which, when placed in a warm temperature, will soon recover. The present is a good time to examine Palms, potting and cleaning, and doing anything that may be required. Some Palms are very liable to be infested with white scale, which may be got rid of by syringing with lemon oil or a preparation of petroleum. They may be rubbed off with the finger and thumb or a damp sponge; but the leaves get less broken if the first-named be employed. After the repotting, place the plants in a warm house, and if no proper Palm-house or stove exists, a vinery at work will serve the purpose. Seaforthia elegans is a Palm that soon turns yellow if exposed to cold, and it is therefore less fit for general use than Kentias. All the Palm tribe delight in a soil in which turfy loam forms the chief part, and this, with the addition of sharp sand, a small quantity of peat and leaf-mould, forms a soil in which any Palm will grow. Latania borbonica, Chamærops excelsa, Corypha australis, and Phœnix reclinata are species that are useful for cool conservatories, but they are not so graceful as some others. Cocos Weddeliana, Areca aurea, and A. lutescens are some of the more useful Palms when young for work demanding tall plants. These require stove-heat to keep them in good condition, and they are the more serviceable if kept in pots of no great size. When these last-named species get leggy, it is best to replace them with seedlings, of which a few should always be growing on.

RHODODENDRONS.—The Indian varieties of greenhouse Rhododendrons that may require to be repotted or trained, should now get attention. The potting soil may consist of fibrous peat of good quality, to which plenty of silver-sand is added. The Countess of Haddington, Edgworthii, and Gibsonii, still hold their own for beauty and fragrance.

GENERAL HINTS.—Bouvardias which may have been kept dry should be watered, syringed daily, and given a little more heat; they will soon afford plenty of blooms. Poinsettias may be cut back and watered, and placed in heat, to encourage growths to form, which may be taken off with a heel if cuttings are wanted. These strike readily in small pots put on or in a hot-bed, or propagating house, affording them shade from bright sunshine. Plants of Euphorbia Jacquiniæflora that have been kept dry at the root should be treated in the same manner, but it strikes readiest from young shoots of 3 or 4 inches in length, taken off with a heel, and the wound allowed to dry, but without allowing the leaves to flag. Plumbago rosea is an excellent pot plant, also when planted out in a bed or border in a not very warm stove it is both ornamental and useful in the winter. Grown in a hot stove, it is a plant that is very subject to thrips, and during spring and summer the warmth of the intermediate-house suffices. It is easily increased by means of cuttings.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

FRAMES.—Peas and such like vegetables in frames must have much attention. Those which were sown in small pots on turves or in other ways for planting in the open, should have full exposure on fine days, and air should also be admitted to the frames at night in mild weather, which should not be covered at all, unless severe frost threaten at night, as the hardier the plants are cultivated the better will they be enabled to withstand inclement weather after being planted. Those which are intended for bearing in the frames should be carefully ventilated, or mildew will be sure to attack them. It is bad practice to coddle Peas, and on sunny days the plants should be ventilated as much as possible without unduly lowering the temperature of the frames. Cauliflower and Lettuce plants, which may have been protected in frames during the winter, should now be hardened off by removing the lights on mild days.

FRENCH BEANS.—Make another sowing of these, and where no heated pits are available, the seed may be sown on a slight hot-bed, for when the seed has once germinated, there will be enough heat retained by the glass to keep up the requisite warmth (55° to 60°) for the growth of the plants. The frames must be matted at night. Attend to those previously sown, and see that they do not suffer from want of water, or the red-spider will soon make its appearance. Thin out where crowded, and afford bearing plants weak manure-water.

PARSNIPS should now be sown on ground that has been well-prepared. It is a mistake to dig manure into the land if it is likely to interfere with the downward course of the root. No better plot for Parsnips can be found than that on which Celery was planted last season. It should be dug one spit, and the soil finely broken up.

POTATOS.—On light soils, the main crop may shortly be planted; but on cold heavy land, planting will be best deferred for a week or two, especially if the sets have been spread out, so that the growth they make is strong. It is not difficult to get good crops from light land, but some extra pains must be taken if fine samples are to be obtained from soils that are cold, stiff, and retentive. Gardeners know

that in order to secure the heaviest crops of Potatos, the land must be in good heart; all the same, this end must not be sought by affording large quantities of fresh or strawy manure at planting time. If land has been properly tilled, it is not necessary to afford manurial dressing at that time. Our land is heavy, and consequently cold, and I find that the first week in April is the most suitable time to plant. The sets are prepared by being stood with the broad ends upwards in the early part of the winter. The growth made is short and stout, so that they are in a good condition for planting at the time named. I prefer to plant whole sets, of medium size, to cut sets, removing all but two or three of the strongest shoots. Before planting, the ground gets a dressing of nitrate of soda, kainit, or other fertiliser, and when the surface is dry, this is forked into it, and at the same time, the soil is rendered as fine as possible. The plot is then marked out for the rows, the distance between these varied according to the growth of haulm of the variety; Ashleaf, and those of similar tops, 3 feet apart; strong-growing, 6 inches more. Drills are then drawn 2 inches deep, and the sets placed in them from 1 foot apart for small growers, to 1¼ foot for robust ones. The soil between the rows is then drawn over the sets till ridges are formed about 9 inches high. Our object in planting so near the surface is, that the roots may be well up above the ground level, as on heavy land, and the method favours dryness of the soil, and makes the latter warmer. Seasons must be wet indeed if, by such treatment, good results are not obtained. On light, dry soils, it is not necessary to go to all this trouble, as such are worked with more ease, and are naturally dry and warm.

ASPARAGUS.—Where this plant is grown after the French fashion (that is, blanching the growth for the greater part of its length), the soil should now be taken out from the alleys between the beds for the purpose of earthing them up; but before this is done, the whole should have a dressing of salt, superphosphate of lime, and nitrate of soda, as these fertilisers greatly promote growth. From experience, gardeners know that an overdose of these powerful stimulants does more harm than good, so that great care is necessary in the use of them. If half a hundred-weight of each be applied to a quarter of an acre, it should be afforded at two or three times for the plants to derive the greatest benefit from their application. On cold land raised beds are the best for Asparagus; on light dry soils, on the contrary, it is far better to have the beds on the flat. If it be taken into consideration that about nine-tenths of this useful vegetable consists of water, it will at once be seen that unless this be plentifully provided, the crop must be a light one. At the same time, the roots will rot in land containing stagnant moisture.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

SHOWY DENDROBIUMS.—The following species and hybrids are such as would make a splendid collection, useful either for cut flowers or for decorative purposes generally:—Dendrobium Ainsworthii ×, D. heterocarpum aureum, D. Cassiope ×, D. crassinode, D. c. album, D. Dominianum ×, D. Findleyanum, D. Leechianum, D. moniliforme, D. lituiflorum, D. luteolum, D. nobile, D. n. nobilius ×, D. n. Cooksoni ×, D. n. Sanderianum ×, and numerous varieties of D. nobile, which are all good. D. splendidissimum grandiflorum, the finest of all the Ainsworthii group, should not be omitted. With a good stock of these Dendrobes, flowers can easily be obtained for six months in the year by hastening some and retarding others.

HINTS ON CURRENT OPERATIONS.—The repotting of the Cypripediums should be followed up as fast as may be convenient. These plants are not so impatient as some, as to what and the time they are potted in, provided the plants are in health. The first that I take in hand are C. barbatum, and the group of which it is the type, and the fleshy-rooted species, C. Curtisii, C. Lawrenceanum, C. Veitchii, C. selligerum majus, C. Io, C. Swanianum. I have found that all of these grow best in good peat and sphagnum moss if the plants are raised to some extent above the rim of the pots, not affording them pots that are too large, in fact, confining them to smallish pots. The crocking of the pots should be thorough, say half-full; and the crocks must be clean. C. Druryii does well in sphagnum moss, with but very little peat. This species grows differently to any other, that is, the rhizome from growth to growth is longer, and it soon runs over the rim of the pot; and to get a compact plant in as small pots as possible, the leading growths should be pegged down from time to time until the roots from these fix themselves in the potting materials. These species of Cypripedium will succeed if placed on the north side of the Dendrobium-house; whereas C. Spicerianum, C. insigne, C. Leeanum and its variety superbum; C. Sallierii, C. œnanthum, and C. Harrisianum are equally happy in the intermediate-house. The best compost for these last-named consists of peat, yellow loam, sphagnum moss, silver sand well mixed together, and the plants potted below the rim, as more water is required by these than those having fleshy roots. The watering of Selenipediums, many of which may be in or will shortly flower, should have careful attention, affording them occasionally weak liquid manure when growing freely. Amongst these species and varieties are C. Stonei, C. Ainsworthii ×, C. albo-purpureum ×, C. cardinale ×, one of the very finest; C. Dominianum ×, C. grande, C. Schroderæ ×, C. Sedeni candidulum ×, C. caudatum, C. caudatum Wallisii. These Selenipediums succeed under the same conditions as C. barbatum, i.e., in a shady part of a warm moist house. When in good health, water must be copiously used, and the plants well syringed overhead.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

PROTECTING PEAR BLOSSOM.—The trusses of bloom-buds on trees growing on south and west walls being already in an advanced stage, and gardeners having good cause to recollect the destruction to the Pear-bloom by the spell of wintry weather about the middle of April last year, nothing more than a reminder will be necessary to impress upon them the importance of protecting the trees in some of the many methods resorted to. Nothing answers much better as an improvised shelter, than a wide board fixed under the coping, the same as advised for Peach and Apricot trees, from which a double thickness of Strawberry-netting is hung; which, if secured properly, will not require further attention till removed, probably early in the month of May. Where insufficiency of netting will not permit of all the fruit trees being thus protected, the cordon trees, if grown, should certainly be protected from frost. If boards cannot be obtained, poles can be used to keep the netting from the trees, which, after being fastened to tenter-hooks at the top of the wall, should also be tied at the bottom to the poles to keep it taut. The same remarks apply to Plum trees when in bloom.

PREPARING FOR GRAFTING.—With the trees, and more especially Pears in such an advanced stage, those of limited experience in grafting may consider it time to begin the work, and hence my now mentioning the matter. Firstly, I would deprecate undue haste, as at least one more week should elapse before grafting begins, the last week in the month being sufficiently early; and even then, unless the weather is somewhat mild, and in other respects favourable for the work, a commencement is scarcely desirable before the first week in April. In young bushes or pyramids, saw off the branches to within 6 inches of the main stem, and on orchard standards and old trees, saw them off about the same distance beyond the secondary branches, which saves at least a season in the refurnishing of the crown with branches. The Pear being ready for grafting at least a week before the Apple, it should be taken first, the Plum and the Apple following in succession, the last being the Apple.

METHODS OF GRAFTING.—Where the branches which are to be grafted do not exceed three-quarters of an inch in diameter, whip-grafting, as practised in nurseries, is the most common, and gives the best union; but for larger branches, rind grafting, which simply consists in forcing a hard piece of wood (corresponding with the size of the scion) down between the bark and the wood, to receive the scion, which, having had a piece 2 or 3 inches long removed from the side with a sharp knife, is ready to be inserted.

PREPARING THE CLAY.—Where this plan still obtains, take some loamy-clay, which beat up well with a spade to the consistency of dough, removing stones; then take about the same quantity of fresh cow-manure and horse-droppings, rubbing the latter through a half-inch meshed sieve, mixing the whole well together, and keeping it in a shady corner to prevent drying.

GRAFTING-WAX.—This I consider in every respect preferable to clay, being easily applied, and not being unsightly; it also requires no after-attention. Grafting-wax may be obtained from the horticultural sundriesman, or the seedsman. In covering the graft with it, dip the hand in water previous to smoothing it over, in the same way dry wood-ashes are used, to prevent grafting-clay sticking to the hands.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

THE LAWN.—If nothing has been done to impoverished turf before this date, there is still time to eradicate unsightly weeds, which now they have begun to grow are easily distinguished. The grass may be greatly renovated and improved in appearance if a top-dressing be afforded of some kind of light rich soil, and if the grass plants are thin, seed of fine grasses may be mixed with or raked into the soil in the proportion of 1 to 2 lb. to one bushel of soil. Most lawns require this kind of treatment each alternate year to keep them in good condition. Where moss infests the turf, much of it may be scratched up with a sharp-toothed iron rake, which if followed with a thorough sweeping with a stiff birch broom, and a dressing of soil and grass seeds, will result in a great improvement being visible the first season. Any re-turfing or levelling remaining to be done should be completed forthwith, otherwise the turves will not have time to get properly settled.

HARDY CLIMBERS.—The pruning of climbers should now be brought to a close, as in many instances growth has begun. Tea Roses, when planted against a wall and liberally manured, make much growth, and it is necessary to thin out that which is weakly, nailing or tying-in the more vigorous shoots at almost full length. Chimonanthus fragrans, Jasminum nudiflorum, or any early-flowering climbers which have gone out of bloom, may be pruned, taking care to lay a good deal of the young wood for producing flowers next season. Wistaria sinensis, Passiflora cœrulea, and its white-flowered variety Constance Elliott, Loniceras of various species, should have weak and lateral shoots spurred in, the leading shoots being fastened in if there is space for extension. The earlier blooming varieties and species of Clematis, which flower on the wood of the previous year, should only have the dead wood taken out at this season, and a little thinning done if crowded. The late-flowering varieties of the Jackmanni type should be pruned back more freely; in fact, it is a good practice every two or three years to cut them back to the ground-line; by such a treatment they form very vigorous shoots from the roots, which cover a great deal more space the same year than the unpruned plants would do in two or three years. Ivy on walls should now have the leaves trimmed off close to the old wood, using hedge-shears for the purpose. It will look unsightly for a time, but the new foliage will soon re-cover the wall, and save further attention being paid to it for the remainder of the year; and not only that, but do away with the nuisance of dead leaves blowing about the place in the summer. Insect chrysalids, &c., get also cleared away with this trimming. Where Ivy is used as an edging plant, the treatment is the same.

HARDY ROCK FERNERY.—Where transplanting or planting are contemplated operations, no delay should occur in making a finish of them. Remove withered fronds and rubbish, and afford a mulching consisting of loam three parts, peat one part, and some sand in addition. This top-dressing will do the plants good, and make the fernery look tidy. The soil should be placed close up to the root-stock or crown, where it will serve as protection from frost.

A Scotch Gardener, balancing the gains made by England and by Scotland respectively of late years, says that Scotland has taken from England bitter beer, Christmas, and Chrysanthemums; and that England has gained from Scotland, whisky, oatmeal, kilts, and bagpipes!

EDITORIAL NOTICES.

Letters for Publication.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* written on one side only of the paper, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to return unused communications, or illustrations, unless by special arrangement.*

Plants, &c., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

SATURDAY Mar. 25—Royal Botanic Society.

SHOWS.

WEDNESDAY, Mar. 22 { Royal Botanic Society's First Spring Show.

THURSDAY Mar. 23 { Paisley Horticultural Society Spring Exhibition (two days).

SATURDAY Mar. 25 { Exhibition of Plants and Flowers at Crystal Palace.

SALES.

MONDAY, Mar. 20 { Roses, Hardy Plants, and Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, Mar. 21 { Japanese and other Lilies, Valottas, Begonias, &c., at Protheroe & Morris' Rooms.

WEDNESDAY, Mar. 22 { Lilies from Japan, Azaleas, Roses, &c., at Protheroe & Morris' Rooms.

THURSDAY, Mar. 23 { Clearance Sale of Stove and Greenhouse Plants, Pitcher Plants, Orchids, &c., at Albert House, Margate, by Protheroe & Morris. Plants and Bulbs at Protheroe & Morris' Rooms.

FRIDAY, Mar. 24 { Picotees, Carnations, Pæonies, Phlox, Pyrethrums, &c., at Protheroe & Morris' Rooms. Orchids from F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—43°.5.

Town Fog.

The second report on this subject, presented to the Scientific Committee of the Royal Horticultural Society by Professor F. W. Oliver, on Tuesday last, is a document of very great interest. We must await its publication in the *Journal* of the Society for the full appreciation of its details. In the meantime, we may say that the author, acting in concert with Dr. Bailey, of Manchester, has pursued the subject in a thoroughly scientific spirit, carrying observation of facts and phenomena as far as his limitations would permit, and then proceeding to investigate the matter further by actual experiment with the deposit itself, and with several of its constituents when isolated.

In this way, the Professor gives details of the chemical analyses of the sooty deposit on the glass and on the foliage, which is so striking a feature of town fog, and then proceeds to give an outline sketch of the effects of fog as observed at Kew, at Chelsea, and elsewhere. Country fogs, uncontaminated with smoke, are quite harmless to vegetation. He distinguishes between those cases in which the leaves become disfigured, but do not immediately or speedily fall, and those in which in addition to the discoloration, there is also speedy disarticulation. The first class of cases are probably the result of the contact of an acid, such as sulphuric acid, with the upper surface of the leaf. Metallic iron (a known constituent of fogs), similarly corrodes the tissues from above downwards.

In the second class of cases, the fog and its noxious vapours not only attack the surface which is protected by cuticle, but they penetrate the interior of the leaf by means of the pores or stomates, and thus come into contact with the delicate and unprotected tissues in the interior, and injure or destroy them. Concurrently with these effects, a removal of the starch from the tissues of the leaves is invariably noticed. Transpiration or the giving off of watery vapour from the plant is also observed to be checked by the presence of small quantities of sulphurous acid gas, so that the plant becomes, so to speak, dropsical.

One very important section of Professor Oliver's report has reference to the varying results exerted by fog on different plants. Ferns, for instance, do not suffer much; nor, speaking generally, do Monocotyledons (including Orchids, Crinums, Palms, &c.). It is among the dicotyledonous stove plants that the greatest amount of damage is done. Speaking generally, the Professor considers Ferns and Monocotyledons as specially shade-loving—or, at least, shade-enduring plants. Our own impression is, that the amount of injury inflicted on the foliage may be more particularly dependent upon the anatomical structure of the leaf. If, for instance, there is a thick cuticle—an underlying layer of water-containing cells, as in many Orchids—or a a double or triple layer of palisade-cells; or if the structure of the two sides of the leaf be approximately uniform, as it is in many Monocotyledons, then leaves so constructed are better equipped to resist injurious agencies, whether of shade or vapour, than are the leaves of other plants less favourably endowed.

Having set forth the usual constituents of fog, and their general effect upon the tissues of the leaves, the Professor proceeds to give an account of the experiments he has made with the isolated ingredients of the fog. Of these, the most interesting are those made on the action of "pyridine." Pyridine is one of many tarry substances derived from the decomposition of coal. It is very volatile, and when its vapour was allowed to come into contact with the surface of leaves, the same effects were produced as are noted in the case of fog. It is thus shown that sulphurous vapours are by no means the only injurious ingredients of the fogs of London or Manchester, but that the "tarry products" are injurious in a high degree.

Besides discussing the directly injurious effects of poisonous vapours, Prof. F. Oliver goes on to discuss the general lowering of tone in the plant, consequent on prolonged absence of sunlight in the winter months, and shows how this diminished vitality renders the injury from fog proportionately greater than it otherwise would be. It is on account of the non-liability of Ferns to this lowering of tone (they being "shade plants") that—in the opinion of the author—this group is able to resist the toxic action of fog, notwithstanding the fact that, mechanically, they are but little protected.

Having dealt with the action of fog upon the foliage, the author next considers its influence upon flowers, showing the changes that take place in the appearance of the flower and in its internal organisation. It is curious to note that while the flowers of Angræcum sesquipedale suffer severely, both in the bud state and when expanded, the flowers of A. hyaloides and A. citratum have always passed through fog uninjured. Other white flowers which remain uninjured are Primulas, Cyclamens, and Chrysanthemums. These variations may be due to differences in structure analogous to those we have pointed out in the leaves, but more probably to differences in their chemical constituents.

In considering remedial measures, Professor Oliver considers the two prominent factors of diminished light and of contaminated air. Diminished light might be remedied by the adoption of the electric light. There is no question that this would be a real remedy, but the objection at present is the cost. Nevertheless, we must recall the fact that some of our American cousins who are at least as good business men as we are, find that it pays to use the electric light in winter in the culture of forced vegetables for market. We have no doubt that in the no very distant future the progressive market gardener will find it to his advantage to use the very potent aid that electricity affords.

As to contaminated air, Professor Oliver details certain methods by means of which the air admitted to houses may be purified, as by filtering it through canvas, or allowing it to pass over charcoal. Mr. Toope's system of ensuring a current of cleansed air through the house is mentioned in terms of approval.

Lastly, the Professor touches upon the cultural precautions to be adopted in foggy weather—these are reducible mainly to lowering the temperature as far as is consistent with safety, and to the maintenance of a sufficiently moist atmosphere. With reference to this matter, the great object, it appears to us, is to keep the plant as much at rest as it is possible to do. The working power of the plant is obstructed and rendered difficult by circumstances. Meet the case by not allowing the plant to attempt to work more than can be avoided. Concurrently with diminished light and contaminated air, which are unavoidable, subject the plant to diminished heat, and (short of dryness) to a diminished moisture, and to a quiet still atmosphere—in a word, carry out the general principle of adapting the plant, so far as circumstances permit, to the conditions under which it is placed.

We are promised in the future a very detailed report or monograph illustrated from the large series of drawings made by the author and his able assistants, Miss Ewart, and Professor Weiss. It is very desirable that the experience of those who have to grow plants in foggy localities near London or our great manufacturing towns should be made known. It would form a valuable adjunct to Professor Oliver's paper. There is in any case ample evidence to show that this report will eventually be of great public benefit, even as already it redounds to the credit of the Professor and of the society under whose auspices these elaborate investigations have so far been carried out.

Blackmoor House.—The illustration given on p. 329, affords a view of the flower garden at Blackmoor, the comparatively new residence of Lord Selborne. The land now forming the gardens and pleasure grounds formed at one time a part of or adjoined the dreary waste of Blackmoor common, which itself is an outlying portion of Woolmer Forest, whose dark looking Fir plantations covering Weaver Downs are seen to the eastward. A more unpromising site for a garden could hardly be found; yet, by a judicious expenditure of labour, and choice of suitable trees and shrubs, a most enjoyable place has literally been created out of waste. We have received the following particulars concerning the gardens from the pen of Mr. Kirk, the present gardener to Lord Selborne:—Along the south front of the house is a broad gravel path of considerable length, from which one looks down off the top terrace on to the two star-shaped

beds, around each of which are eight smaller ones. These are filled in summer with bright-coloured flowers suitable to the design. The parterre is reached by a flight of stone steps from the broad walk above-mentioned. In spring the beds are filled with bulbs, Silene pendula, Collinsia, Limnanthes, Myosotis, Wallflowers, and other plants. Adjoining these on the upper terrace are two fine old Oaks, which form a pleasant retreat from the sun. The larger flower garden is reached by another flight of stone steps, and consists of about forty large beds, which when seen from the terrace have a fine effect. Some of the beds are filled with Ghent Azaleas, which as well as being so lovely when in bloom, are very showy late in the autumn with their many-coloured foliage. There are besides these four beds of Aucubas, and some good specimens of Cupressus erecta viridis dotted about amongst the beds. Near the walk some Yews are planted; in the centre is a large Rhododendron bed, amongst which four years ago bulbs of Lilium auratum were planted. To the right of the upper terrace, looking across the lawn, is a piece of water with a rustic bridge, come into view, and around the water large clumps of Rhododendrons are planted. A spacious herbaceous border forms part of the furnishing of the garden, and the collection of hardy plants is an excellent one. At the back of this border is a hedge of Arbor-vitæ, dividing it from the Park. In another part are beds of Roses arranged in radial fashion. Roses do not flourish in the light sandy soil, but by using plenty of farmyard-manure and heavy loam brought from a distance, a rich harvest of excellent bloom is obtained. The kitchen garden is enclosed by walls, and here the various glasshouses are placed. Outside the walls is a rockery, about 40 yards long, which, although made and planted only last spring, is now nearly covered with the various species of Sedum, Saxifrage, Aubrietia, Sempervivum, Anemone, dwarf Phlox, Thyme, Cyclamen, and many others. Much effective planting has been done in and about the gardens, and Conifers have been prodigally used as hedges, screens, in masses, and as solitary specimens. Sequoia, Cryptomeria, Cedrus, Abies, Picea, and other species are growing into fine stuff in the light sandy soil. The total area of the garden measures about 16 acres.

Fig. 47.—THE GARDENS AT BLACKMOOR HOUSE, SEAT OF THE RIGHT HON. LORD SELBORNE. (SEE P. 328)

THE ROYAL GARDENERS' ORPHAN FUND.—We are informed by Mr. A. F. Barron, the honorary secretary of the above, that by request of the chairman, Baron Ferdinand de Rothschild, M.P., the annual dinner of the Royal Gardeners' Orphan Fund, arranged for March 22, is postponed to Wednesday, April 26.

SUMMER SCHOOL OF ART AND SCIENCE.—The Edinburgh summer meeting for the promotion of vacation studies is to extend from July 31 to August 26. The general scheme may be illustrated by the following extract from the programme:—

Starting from the familiar idea of working from the concrete to the abstract, from the senses towards the intellect, it is attempted in each subject of study (1) to freshen the student's mind by a wealth of impressions; (2) to introduce him to the advancing literature of the subject; (3) to supply him with the means of summarising, arranging, and more clearly thinking out these accumulations of observation and reading. Hence (1) the insistance upon demonstrations, experiment, and field excursions; (2) the introduction in several subjects of the Seminar, which, with its guidance to the world of books and activity in using them, is so marked a strength of the German University; (3) the extended use of graphic methods.

The student, though first of all freshened as an observer, is regarded not as a receptacle for information, but as a possible producer of independent thought. Hence the examination method, everywhere falling into such merited disrepute, is here definitely abandoned; a keener stimulus, even a more satisfactory test of progress, being found in accustoming the student to take part in his own education, by attention—first to the increase and systematisation of his materials, next to the occasional contributions of his best results, to the common stock of class notes and summaries, and thence to fuller collaboration with his teacher.

We have no space to enter into details of the whole scheme, but we may extract those particulars most interesting to our readers:—

III. Biology.—Twenty lectures—fifteen by Mr. J. Arthur Thomson, M.A., Lecturer on Zoology and on Biology in the School of Medicine, Edinburgh; and five by Mr. Norman Wyld, Assistant Lecturer on Biology, University College, Bristol. 11—12 daily Class Assistant, Mr. G. H. Barker.

First Fortnight. — "Bionomics." 1. Relations between Organisms and Inorganic Nature; 2. Relations between Plants and Animals; 3. Relations between Plants and Plants; 4. Relations between Animals and Animals; 5. Man's Place in Nature.

Second Fortnight.—"Evolution." 1. Evidences of Evolution; 2. History of Ætiology; 3. Heredity, or the Relation between Generations; 4. Primary, or Originative Factors in Evolution; 5. Secondary, or Directive Factors in Evolution.

IV. Practical Botany.—Twenty lessons, in great part in the field, by Mr. Robert Turnbull, B.Sc., Lecturer on Agricultural Botany to the County Council of Aberdeen. 2—4 daily.

V. Practical Zoology.—Twenty Lessons, mostly at Granton Marine Station, by Mr. J. Arthur Thomson, assisted by Miss Marion Newbigin. 2–4 daily.

VI. Field Geology.—Ten lessons on Field Geology, by Mr. Norman Wyld. 2—4 daily during first fortnight.

Cash on Delivery.—A petition to the Postmaster-General is in course of preparation, setting forth—

"That in the interests of British commerce it is desirable to introduce the 'Cash on Delivery' system into the General Post Office.

"That such a system is successfully working in the British Colonies, and in almost every European country.

"That it would be equally a boon to the public as the trader, and a protection to both against fraud.

(*a.*)—To the public because under the system they need not pay for goods until actually delivered.

(*b*).—To the trader because the cash value for his goods would be insured.

"That the fact that the parcel delivery companies have worked the system successfully and profitably proves that the superior and wider reaching machinery of the General Post Office may be employed in the same direction with at least equal success.

"That the introduction of the 'C. O. D.' post would give an enormous impetus to commerce generally, and that no opportunity of promoting the interests of trade throughout the country should be lost by the Post Office, especially when at the same time it is likely to be productive of profit to the department."

The Secretaries to the movement are Messrs. Warden & Wood, offices of the *Gentlewoman*, Arundel Street, London, W.C.

Guild of Kew Gardeners.—We are requested to draw attention to the notice of the above society, which appeared in our columns a few weeks ago. All old Kewites, who have not yet sent in their names and addresses for publication in the Guild's *Journal*, should do so without delay.

Fruit Growers' Association.—A general meeting of the subscribers will be held shortly to determine the course of procedure to be adopted in the present state of the Association. The main point to be discussed is, whether the Association shall be dissolved, or whether in view of the work already done and the field still before it, its operations shall be continued.

Earl's Court Exhibition, 1893.—At a representative meeting of horticulturists, held at the Hotel Windsor, Mr. H. E. Milner in the chair, and among those present being Mr. William Paul of Waltham Cross, Mr. G. Francis Rivers of Sawbridgeworth, Mr. G. Cheal of Crawley, Mr. H. G. Cutbush, Mr. John Laing, Mr. Harry Turner of Slough, and several others. The chairman gave a brief programme for the Exhibition of Gardening and Forestry to be held at Earl's Court this year, which, especially as regards the forestry section—at present the most advanced—is being most cordially supported by the Woods and Forest Department and the Agents-General for the Colonies, also the leading landed proprietors. Mr. Milner stated that the Exhibition was promoted by private enterprise, at the same time he saw no reason why practical and scientific horticulture and forestry should not be advanced by this year's Exhibition—and, in fact, it was mainly with this object in view that he was induced to take the prominent position he had; and he hoped that those present, and all horticulturists, would give him their support, not only in their own interests, but also for the benefit of the general public. Mr. George Cadell had undertaken the charge of the forestry department, and in his capable hands he was sure that that section would be well represented. With regard to horticulture, it is proposed to hold a series of flower shows fortnightly, commencing on May 13 until the end of September, under canvas this year, and efforts will be made to make the display, as far as possible, continuous in the intervals between the fortnightly shows. In the grounds it is proposed to demonstrate the planting of woods for cover and shelter, &c., suitable for the four main classes of soil, specimen of timber and ornamental trees, especially those usually classed as pictorial trees. It is also proposed that this section, which will doubtless prove of great interest to landed proprietors, managers of forests, &c., be further supplemented by a series of representations of the best evergreen, deciduous trees and shrubs, suitable for London and town gardens, and other features likely to be of value from an educational point of view. Very liberal prizes will be offered in the competitive classes at the fortnightly shows; and with regard to extraneous exhibits, it is proposed that the award shall take the form of Silver Cups or Silver Plate, instead of Medals—but a Gold Medal of higher value will be awarded to exhibits of superlative merit. The proposals set forth by Mr. Milner were heartily supported by Mr. William Paul and others, in consideration of the able and satisfactory manner in which the International Horticultural Exhibition of last year was conducted by Mr. Milner. A small committee was then formed to draw up the schedule and carry out the details. H.M. Commissioner of Woods and Forests, the Trustees of the British Museum, the Director of the Science Division, and the Keeper of Zoology, South Kensington. The Deputy Surveyors of the New Forest and Dean Forest, &c., have already promised their valuable aid and exhibits; while under the kind permission of the Science and Art Department, a collection of woods from Japan—a country which possesses the most remarkable variety of flora in the world—will be shown.

The United Horticultural Provident and Benefit Society.—The annual meeting of this useful Society took place on the 13th inst., at the Caledonian Hotel, Adelphi. Mr. G. J. Ingram presiding, supported by the trustees, and a large number of members. The annual report, read by the Secretary, was of a remarkably satisfactory character; the chief points being emphasised by the Chairman in moving its adoption, who said that in looking through the rules he was struck with the advantages offered to the members by the Society over those of other benefit societies. In the first place, in addition to being a benefit society, it was also a savings bank, interest being added to each member's deposit; and the deductions under the rules were very slight indeed. The Benevolent Fund supplied a distinct advantage over other societies, as by it the Society was able to assist distressed members, and in the event of their death assistance could be rendered to the widow and orphan children. Then there was the Convalescent Fund, the subscriptions to which were voluntary, any member could contribute to it or decline to do so; and out of which a sick member could be granted a sum to enable him to go away for a beneficial change when recovering from an illness. In the face of such advantages, he wondered so few gardeners were associated with the Society as members, and he thought it must be because the Society was so little known. The growth of the membership during the past ten years had been remarkable, though the numbers were limited. In 1882 there were 104 members only; in January, 1892, the number had risen to 442, and now it was 474, though he thought it should be several times that number. In 1882 the income of the Society was £243 6*s.* 8*d.*; in 1891, £1037 5*s.*; at the close of the financial year, 1893, £1228, including a donation of £100 from Mr. and Mrs. Harry J. Veitch on the celebration of their silver wedding. Not less remarkable had been the growth of the investments of the Society. In 1882, the total amount invested was £2488. In 1891 this amount had been increased to £6700, and at the present time it was £7700, £1000 having been added during the past year. In conclusion, the Chairman earnestly advised the members to make the Society known in their several localities, and thus secure a substantial increase in their numbers. The financial statement made by the Treasurer, Mr. J. Hudson, showed that contributions from life members amounted to £63; from ordinary members, £857 14*s.* 5*d.* From Mr. and Mrs. H. J. Veitch, £100, which was carried to the convalescent fund; and dividends on investments, £207 10*s.* 5*d.* On the other side, sick pay has amounted to £88 12*s.* 8*d.*; £32 5*s* 11*d.* had been paid to the representatives of deceased members; management expenses and Secretary's salary had amounted to £62 6*s.* 9*d*, and £1000 worth of Stock had been purchased at a cost of £981 3*s.* 6*d.*, leaving a balance of £173 12*s.* 9*d.* to be carried forward to 1893. The motion for the adoption of the report and financial statement was carried by acclamation. Messrs. Cole, Peerless, and Kelk were re-elected members of the committee, and Mr. A. Hemsley, in the place of Mr. Dickens, retired. The Trustees and Secretary were re-elected, and hearty votes of thanks given to them for past services. The Treasurer and auditors were also thanked; the former, in responding, said eleven new members had been elected that evening. The proceedings closed with a cordial vote of thanks to Mr. Ingram for presiding.

A Public Park at Johannesburg, Transvaal.—Our esteemed correspondent, Mr. R. W. Adlam, in a note accompanying a communication on South African plants, writes:—"I have just been appointed to an important post in this town, viz., Superintendent of Public Parks and Street Planting. I have just now a big job on hand in laying out Joubert's Park, an area of 17 acres, from an architect's, not a landscape gardener's plan. My scheme is this. First a hedge of Cupressus macrocarpa planted right round next to the boundary fence, then a mixed shelter-belt inside this, consisting of Eucalyptus robusta, E. globulus, Pinus insignis, Casuarina tenuissima, Acacia dealbata and melanoxylon. The principal avenues are to be planted with English Oak, Eucalyptus robusta, Planes and Tulip trees. There will be beds of flowers, groups of flowering shrubs, ponds for Nymphæas and Nelumbiums, a rockery and fernery, a rosery, and a collection of native plants arranged in Natural Orders. Lawns and specimen trees are a *sine quâ non*." If Mr. Adlam carries out his ideas of making use throughout of the more suitable native and Australian trees, shrubs, and flowers, to the exclusion generally of others, and at the same time he is enabled to make a large and extensive collection of South African, or merely native plants arranged in their Natural Orders, he will have rendered good service to the inhabitants of the Transvaal in general, and Johannesburgians in particular. We would venture to exclude even English Oak from the planting, if only because of its slow growth. We shall return to the subject of Johannesburg and its gardens, and horticulture generally thereabouts, in an early issue.

Flowers, &c, in Hyde Park.—Large breadths of pretty colour are afforded by Crocuses and Snowdrops, &c., in some parts of this park. Patches of Winter Aconites, with their dark green foliage and yellow blossoms, harmonise with the lighter green of the turf. The mild weather that prevailed last week has brought out the bloom of the Almonds amazingly. Rooks' nests are again being built in increasing numbers in the Elm trees on the west of the Broad Walk in Kensington Gardens at the rear of the Orangery; and there is every prospect of a colony of rooks taking up their abode once more. There have only been a few stray nests since the old Elms were felled in which these birds used to nest.

Jean Chauré.—We regret to hear of the death of M. Jean Eugène Chauré, who died on the 1st inst., in his seventy-second year. Originally a nurseryman at Vitry, he devoted much time and skill to the propagation of new plants and the raising of hybrids, and took much interest in all questions relating to horticulture, and in 1877 founded the *Moniteur d'Horticulture*, a fortnightly

journal devoted to the diffusion of horticultural knowledge. At Parc Saint Maur he established an experimental garden, at which he gave occasional lectures and demonstrations.

NEW YORK BOTANIC GARDEN.—According to the *New York Tribune*, Mr. J. PIERPOINT MORGAN has practically obtained the 250,000 dols. required to start the garden. Seven cont ibutors had already given 25,000 dols. each, and it is expected that other three contributors of the like amount will speedily be found. This money will, it is estimated, secure 250 acres of land for the purpose, but a million dollars will be required to defray the cost of buildings and installation.

THE HORTICULTURAL COLLEGE, SWANLEY, KENT.—On Thursday, March 2, a meeting of the Experiments Committee, in connection with the Kent County Council, was held at the Horticultural College, Swanley. Specimens of Black Currant buds attacked by mites, and branches of Gooseberry bushes attacked by scale, were examined by a lens and microscope. Professor CHESHIRE explained the life-history of the scale. Spraying with either Paris Green or London Purple was recommended as a remedy. It was decided to spray one of the plantations with Paris Green, and the other with London Purple, to destroy the insects. At the next meeting, March 16, an account of the Cucumber disease due to the presence of eel-worms is to be given.

PLANTING AT BARRY LINKS.—We learn from the *Scotsman* of the 4th inst., that the War Office has decided to plant with forest trees a portion of the Links at Barry, so as to provide increased shelter for the military encampments there. They have entrusted Messrs. METHVEN & SONS, nurserymen to the Queen, Edinburgh, with the carrying out of this important work.

DR. JUSTUS KARL HASSKARL, the veteran Cinchona pioneer, who is now living at Cleve, in Germany, has been awarded a Gold Medal by the Dutch Government, in acknowledgment of the gift of his herbarium to Leyden University, says the *Chemist and Druggist*. The herbarium consists of over 20,000 botanical specimens, mostly collected by the donor, and arranged by him. Dr. HASSKARL has also presented to the same university his valuable collection of Cinchona specimens.

PAVING BLOCKS OF COIR.—Coir or Cocoa-nut fibre is compressed into blocks with the fibres arranged vertically. The fibres or blocks may be steeped in or treated with tar, pitch, resin, creosote, or with a solution of india-rubber or gutta-percha. Brick-dust or fine sand may be mixed with the tar, and the blocks may be bound round by bands. Mr. J. HART-DAVIES, 186, Fleet Street, London. (J. MCDONNELL, Chilaw, Ceylon). *Patent Journal*, December 14, 1892.

DIOSCOREA IN THE CAUCASUS.—When a species of Dioscorea was found in the Pyrenees, the fact excited much interest among plant-geographers, and this will be accentuated by the discovery of another species in the Caucasus. D. caucasica is described by our correspondent, Dr. ALBOFF in the *Acta Hort. Petropolitana* for January as occurring in the fissures of calcareous rocks in Abchasia. It is said to resemble D. villosa of JACQUIN in the creeping rootstock and foliage, but differs materially in floral details. The genus is essentially tropical and subtropical in its distribution, but these outlying species will give rise to much speculation as to how and why.

FIG. 48.—PRITCHARDIA VUYLSTEKEANA. (SEE P. 332)

BINGHAM GARDEN AND ALLOTMENT HOLDERS ASSOCIATION.—In connection with this society, a lecture was delivered on Wednesday, March 8, by M. S. THACKER, of Nottingham, on "Grafting, Planting, and Pruning of Fruit Trees." There was a large and appreciative audience. The lecturer did not confine himself to only lecturing, but also by means of diagrams and trees, showed the right way of pruning, grafting, &c. A discussion followed the lecture.

LABELS.—Mr. MAX LEICHTLIN has sent us samples of labels, made according to his directions, and some of which were distributed among the members of the Royal Horticultural Society on Tuesday last. They are made, some of toughened glass, others of porcelain with one surface slightly roughened, so that it can readily be written on by a moderately-hard pencil. The inscription on the glass labels can easily be effaced by moisture, that on the porcelain may be removed by the use of sand-paper, or a little sand. The cost for labels (each about 7½ inches long by 1¼ inch wide) is at the rate of £1 per 100. They are clean serviceable labels, specially adapted for indoor use, and though not quite unbreakable, yet resist considerable force. Some have been sent by us to Chiswick and to Kew, as well as to private growers, so that they may be tested in use.

ROYAL HORTICULTURAL SOCIETY'S EXAMINATION IN HORTICULTURE.—As affording intending candidates some notion of the subjects in which they will probably be examined, we give the questions which were put to those who attended the first examination, that of 1892, it being understood that the candidates had received instruction in the subjects to which the questions refer:—

EIGHT QUESTIONS ONLY TO BE ANSWERED.
ANY EIGHT THE CANDIDATE PREFERS.

1. What constituents do plants obtain from the soil, and how do they obtain them?
2. Explain the benefits to be derived from draining, digging, and trenching the soil.
3. What differences exist in the cultivation of green crops, and of root crops respectively? What kind of manure is suitable in each case?
4. What advantages are derived from dressing the land with lime, and how ought it to be applied? For what purpose is gas lime of value?
5. What is the most appropriate season to apply nitrate of soda to crops? And state the reasons for the choice.
6. For what objects is pruning resorted to? Why is summer pinching in some cases preferable to pruning?
7. Name some fruit-bearing trees and bushes which bear on the old, and some which produce fruit on the new wood, and state what modifications are consequently required in the method of pruning.
8. What methods would you adopt to get rid of (*a*) annual weeds, (*b*) perennial weeds?
9. Give a brief sketch of the life history of the winter moth, and state what measures are most likely to be effectual in keeping it in check.
10. Name some other insect pests affecting fruit trees, and indicate methods of destroying them.
11. In what ways does the Potato and Tomato-fungus (Peronospora) do harm to the Potato, and to the Tomato respectively?
12. How may ravages of the Potato-fungus (Peronospora) be kept in check?

EIGHT QUESTIONS ONLY TO BE ANSWERED.
ANY EIGHT THE CANDIDATE PREFERS.

1. What are the characteristics of good garden soil, and what steps should be taken to improve a soil that is too light, and one that is too stiff?
2. Point out the advantages of deep cultivation, and describe the proper method of trenching the ground.
3. Describe the best methods of cultivating Potatos to obtain an early and late supply under varying conditions of soil and position.
4. What is the most suitable time for sowing seeds of green crops (Cabbages and the like)? Give a brief outline of the principal points to be observed in their culture.
5. Describe briefly the methods of propagating Gooseberries, Currants, Raspberries, and Strawberries.
6. What are the conditions requisite for the success of grafting and budding? State the best time of year for performing those operations.
7. Name some of the trees and shrubs that are propagated by budding and by grafting respectively, and state why those operations are performed.
8. What are the objects sought to be obtained by earthing-up Potatos, Celery, Peas, and Cabbages?
9. What special effects are produced on plants by nitrogenous manures, whether of animal or vegetable origin?
10. To what crops, and at what season, may superphosphate of lime be employed with advantage?
11. How are weeds injurious, and why are some more so than others?
12. What methods should be employed to destroy weeds?
13. What are the principal insect enemies of the Apple and state briefly the best methods of dealing with them?
14. What are the most common enemies of Cabbages, Turnips, and Celery, and how may they best be combated?
15. Which parts of a flower are essential, and which accessory?
16. What steps would you take to prevent fertilisation through the agency of insects, so as to keep a particular stock "true?"

Crystal Palace.—The Queen having decided to open the Imperial Institute on May 10, the date fixed for the grand summer show at the Crystal Palace, the directors have, in consequence, decided to hold the exhibition on May 11 and 12.

PLANT PORTRAITS.

Agave Victoria Regina, *Illust. Monatshefte*, January, t. 1.

Aster roseus, *Revue de l'Horticulture Belge*, March 1.—A form of A. Novæ Angliæ.

Solanum jasminoides, *Revue de l'Horticulture Belge*, March.

GARDEN PALMS.

(*Continued from p.* 260.)

Podococcus Barteri, *Mann and Wendl.*

This is a monotypic genus, related to Wallichia, which it resembles in the wedge shape of its leaflets. It was discovered by Mann and Barter in swampy places at the mouth of the Gaboon, and several other rivers on the west coast of Africa. For its introduction we are indebted to Herr Wendland, who has had it in cultivation at Herrenhausen some years, and who presented two little plants of it to Kew in 1887. Seeds of it were collected by Mr. H. H. Johnston, and sent to Kew in 1886, but they failed to germinate. In a letter to the Director, Mr. Johnston gave the following account of his discovery of this Palm:—

"One day, when taking a walk in the vicinity of Brass (a sandy island in the Niger delta, facing the sea, and differing from the neighbouring swamps in being firm land covered with lofty trees), I saw growing a Palm that was quite new to me as an African species. It is rather low-growing, and the fronds are strangely Fern-like. The flowers grow on a long whip-like spike, which ceases to be erect when the fruit is mature; it then droops downwards. The fruit resembles in look a small Date, and gives forth a strong honey-like smell, so strong, indeed, that the presence of the Palm may be suspected long before it is seen."

There is a full description and figure of this Palm in the *Linnean Transactions*, vol. xxiv., p. 426, by Wendland, who states that Podococcus is distinguished from all other genera by its pedicellate ovary, and by its fruit, which when mature stands at almost right angles with the pedicel. It grows to a height of from 5 to 8 feet, the stem slender, Bamboo-like, with suckers at the base, and with six to nine leaves forming a graceful loose head; each leaf is about 5 feet long, with eight or ten glaucous green leaflets, which are elongate eliptical, plicate, the largest a foot by 4 inches, the margins jagged and toothed. The spadix is unbranched, slender, and 2½ feet long, the fruit ¾ inch long, yellow when ripe. They are peculiar in having a short curved stalk.

The young plants at Kew are healthy, but they grow very slowly, and sucker very freely, although kept in a hot moist house. They are quite distinct from all other Palms.

Pritchardia, *Wendl. and Seem.*

This genus was founded by Wendland and Seemann upon a Palm discovered by the latter in Fiji in 1860, and named in honour of W. T. Pritchard, Esq., H.B.M. Consul in Fiji at that time. It was figured and described in *Flora Vitiensis* under the name of P. pacifica. When full grown, it is said to have a trunk about 30 feet high, smooth, straight, and 1 foot in diameter at the base. It bears a crown of about twenty leaves, which are quite spineless, soft in texture, like some of the Carludovicas, with fibrous fluffy petioles, and broad fan-shaped blades, which, when young, are covered with whitish down; the largest leaves are from 5 to 6 feet in diameter. The flowers are borne on erect brush-like spadices, which are exposed, owing to the early decay of the spadix. The fruit is round, ½ inch in diameter, cherry-like, black-purple when ripe. The pericarp is thin, not fibrous, but brittle and easily broken; the seed is round, not unlike that of Sabal, with a smooth brown surface and milk-white albumen. Seemann introduced this species by means of seeds, which, he says, "germinate freely, and out of a handful thrown carelessly into a Wardian case in Fiji, more than thirty had begun to grow when they reached New South Wales, where they were taken care of in the botanic garden, and duly distributed among the various establishments forming collections of rare and beautiful Palms." Three of these seedlings were received at Kew in 1864, and what I take to be one of them in the Palm-house has now a stout stem about 10 feet high, with a grand head of very large, noble, leaves. There is a still taller example in the botanic garden at Leiden, measuring 25 feet high, including the leaves. It appears to have become plentiful soon after its introduction, for we find it in several of the nursery catalogues before 1870, in which year Messrs. J. Veitch & Sons exhibited a fine specimen of it before the Linnean Society. The genus has been monographed by Beccari in *Malesia*, vol. iii. (1890), according to whom there are nine good species, all natives of small islands in the South Pacific. Six of these are in cultivation, beside two others supposed to belong to this genus, and named P. aurea and P. borneensis, both Lindenian introductions. The species resemble one another very closely in general characters, but differ in inflorescence, and especially in the size and form of the fruits, which in P. Gaudichandii are as large as Walnuts, whilst in P. Thurstonii they are smaller than Peas. The leaves of P. pacifica appear to be the largest. P. Thurstonii was introduced to Kew from Fiji in 1883, and named in compliment to its discoverer, the present Governor of Fiji, Sir John B. Thurston, one of the most active of Kew colonial correspondents. It has the habit of P. pacifica, from which it differs by its long slender flower-stalks, which are like long fishing-rods, bearing a thyrse-like inflorescence at the extremity. It is figured and described at length by Drude, in *Gartenflora*, 1887. The species appear to seed freely; the seeds are easily imported, and germinate readily, and the plants grow quickly and healthily in an ordinary stove. B. Gaudichaudii and P. Martii were in cultivation before 1874. P. Pericularum and P. Vuylstekeana (fig. 48), were introduced by Vuylsteke, of Ghent, who exhibited them as new plants at the Quinquennial Exhibition held in 1883. They are said to be from one of the Pomotu Islands, which is, or was, uninhabited, and had never previously been visited by Europeans.

The name Pritchardia has also been used for a Californian genus of Palms now known as Washingtonia, and also for two species of Licuala, viz., L. grandis and L. Veitchii. True Pritchardias have no spines, their leaves are exceptionally soft and pliant, and they differ from all other fan-leaved Palms in the form of the blade, which is cuneate in outline. The seedling leaves are undivided. Cultivated species:—

P. aurea, Hort. Linden (1882).
P. borneensis, Hort. Linden (1891).
P. Gaudichaudii, Wendl., syn. P. macrocarpa, Lind. Sandwich Islands.
P. Martii, Wendl. Sandwich Islands.
P. pacifica, Wendl. and Seem. Fiji.
P. Pericularum, Wendl. Pomotu Islands.
P. Thurstoni, Drude. Fiji.
P. Vuylstekeana, Wendl. Pomotu Islands.

W. Watson.

KEW NOTES.

The Forsythias.—Amongst March-flowering shrubs the Forsythias are of importance, F. suspensa in particular, as this is of freer growth than F. viridissima. Both kinds resemble each other except in habit, the flowers of the richest yellow, and produced in great profusion. Whilst F. suspensa can be grown as a climber against a wall, F. viridissima is decidedly a shrub, the shoots quite erect and stiff, and smothered with bloom in early spring. It should be planted in every large garden where good shrubs are appreciated for its early flowering, as in March trees still bear a wintry aspect. At Kew a very interesting bed near the Succulent-house is composed entirely of F. suspensa. The plants are only a few feet in height, but the shoots are trained across the bed, and some hang down gracefully, presenting a mass of yellow flowers at this season, quite one of the brightest effects it is possible to get in early March. The soil for Forsythias should be fairly light, and although they are perfectly hardy, it is well to give slight shelter from cold winds. The more useful and beautiful of the two is F. suspensa.

Rhododendron Thomsoni.

This beautiful species, introduced from Sikkim about the year 1851, is flowering freely at Kew. It is quite safe to plant it in the open, if the situation is sheltered, and is grown in the Royal Gardens in the dell, also in a specially-prepared bed of peaty soil, which has the shelter of adjacent plant-houses. The flowers are deep crimson, campanulate, and borne from 6 to 8 together in a head, the leaves abundant, deep green, and in rich contrast. When in full bloom, a well-grown specimen is remarkably handsome, the flowers so rich and distinct in colour. R. Thomsoni is uncommon in gardens, but there is a fine specimen in the interesting garden of The Denbies at Dorking. It is grown there in one of the highest spots, 610 feet above the sea-level, but the plant is in the centre of a group of Rhododendrons, and thus protected from cold easterly winds and late frosts, which injure the flowers. It is quite necessary to give shelter of this character.

Narcissus at Kew.

All who are interested in Narcissi should visit the Royal Gardens, Kew, at intervals during the ensuing weeks, as a complete collection is grown and planted in a pleasing way. The bulbs have made rapid growth during the past few days, and the earlier flowering forms are commencing to bloom. Narcissus pallidus præcox is planted largely in the grass on the mound near the Cumberland Gate entrance, and the flowers make a sheet of soft colour, to be followed later on with other kinds, the season ending with the forms of N. poeticus. Visitors to Kew appear most interested in this garden of Narcissi, for such it may be called, and the bulbs have become thoroughly naturalised. The early-flowering kinds should always have as much shelter as possible, owing to keen easterly winds which prevail when they are in full beauty. An east wind dries up the segments, and the flowers lose freshness and character. Since the new entrance from the rockery to the herbaceous garden has been made, this portion of the grounds is most visited, as it is now more accessible. This fine old wall clothed with rare climbers is of interest, and also the broad border in front, filled with a collection of Narcissi, each section grouped by itself, and every species and variety represented by a large clump. This border of Narcissi is one of the most interesting and pleasing spots in the Royal Gardens during the spring months. On the rockery N. minor, N. minimus, and N. cyclamineus are in full bloom. N. minor will succeed in a more exposed position than the others, and is a charming form, the flowers

small, but produced very freely, and of a rich yellow colour. A good spot for N. minimus is at the base of a wall, in fairly moist soil, away from cold winds; it is a little gem, not more than 4 inches in height, and very free. N. cyclamineus and its var. major, which has larger flowers than the type, should be grown in quite a moist place, even quite boggy soil. It is found in Spain growing by the side of streams. Many who have this Narcissus in their collections, fail to grow it well, through not planting the bulbs in a boggy soil, and in a position sheltered from cold easterly winds. It is so distinct and attractive that it repays for good cultivation. *V.*

Home Correspondence.

THE PRESERVATION OF BROCCOLI.—I see "X." draws attention to the plan of covering the ground about the plants during the winter with strawy litter. My experience of it is, that it does no good whatever, because it is just at the base of the leaves where the frost affects the plants. It is not possible to cover vulnerable parts of the plants so effectually as to exclude frost entirely. If the mulch is high enough when put on, the rains force it down, and it leaves the tenderer part exposed to frost. Another objection I have to mulching, on strong land especially, is that moisture is kept in the soil, which remains always wet. These conditions cannot be favourable to the preservation of Broccoli. The important point to observe is to select only hardy varieties, sow early, and give the plants plenty of space, so that they can mature their growth, thus rendering the stems less susceptible to frost. If these points are observed and acted upon, and they are really the chief, there need be little fear of Broccoli plants receiving serious injury, in the open fields at any rate. *S.* [In the south. Ed.]

HARDY BROCCOLI.—I am rather interested in my beds of Broccoli this year after the hard weather, and am very pleased to find two varieties have stood the test of severe frost well, as not two per cent. have succumbed. These two varieties are Veitch's Model and Leamington. In the case of four other varieties, quite two-thirds have perished. The reason for the immunity from loss of the first two is their dwarf stature; thus, the stems were better protected by the leaves, whereas those that perished were very tall. I should like to know if Veitch's Model and Leamington are naturally dwarf kinds, as I have never grown them before. *A. Long, Wyfold Court, near Reading.*

GROS COLMAR GRAPE.—Differing as I do with "J. S." in the matter of pruning, it may be of interest to readers of the *Gardeners' Chronicle* to be told that all cutting back is done by me to one bud. For this, I have many reasons, and the chief one is the production of a regular and profitable crop of Grapes year by year with the least possible risk. I am not going into the merits of the long-rod method at this time, but will confine my few remarks to my own practice. Pruning year by year to one eye, we find that when the Vines break there is generally another bud showing at the base, and frequently this is the one that is left for fruiting, and, of course this tends to keep the spur short. To my mind, it is not so much winter pruning that is the cause of success; but rather the continuous attention to stopping, &c., of the previous summer's shoots, the bunches being then formed in the dormant bud; and be they large or small, we cannot alter them much by what is done in the spring, beyond encouraging a regular break in the Vine. That it is a fact Gros Colmar is not hurt by close pruning and summer pinching; and another is, that we get plenty of fibrous roots nearer the surface than is usual with the long-rod method; although possibly larger bunches may be taken from long rods, as one can also do by leaving two or three eyes at pruning; but never do these bunches fill up and make such useful ones as when grown on a close-cut spur. *Stephen Castle, Fordingbridge.*

GARDEN LABELS.—Your correspondent speaking of these, March 4, p. 265, says that, "what we want is a clean label of a light colour, not likely to get smashed by rough treatment, holding the writing well and of a material that can be written with a pencil. The great drawback to the use of zinc is that the writing must be effected by a special ink, and that it never looks clean." What he says about wooden labels I do not question, but I think that with regard to zinc very different views on several points are held, at which I will briefly glance. His communication further tells us that he has produced a label that he thinks comes nearer to perfection than any label hitherto produced. This is rather a big statement, and must imply that he is acquainted with the vast variety of labels now in use, and presumably those in use in this country. From my own experience with a vast number of correspondents, chiefly lovers of open air flower gardening, many of whom have improvised capital labels of a more or less imperishable character, I should be inclined to believe that hardly any man can know the nature and capabilities of the vast number of ingeniously-made labels at present in use out-of-doors. I have seen so many of these with my friends that I might almost have formed a museum collection of them, so that I think he is a bold man who will say that he has beaten the record. Far be it for me to deny that he has done so, but I cannot resist a suspicion that he may be in error when his communication finishes up with these words respecting the labels he has produced, viz.:—"For indoor use, for pot-plants or Orchids, they are unsurpassed." I hardly need say that for these special uses we have a dozen or more labels already that fully answer the conditions required of a label as by him specified. It is the outdoor label that is the puzzle. If he has a label that will keep clean, that will last for a lifetime, carry a name distinctly, written with a pencil (presumably a lead-pencil), such as a gardener carries in his pocket, he doubtless has a label worthy of favourable consideration. I have been at label-making for my own use for at least twenty years, for open-air purposes exclusively. It is well-known that imperishable labels can be produced, and hitherto I believe that all have been made of metal, either wholly lead, zinc, or iron. Zinc has the advantage over iron and lead, from the fact that it may receive the name intended by the writing process, whereas lead and iron require to have the name either stamped or cast. I am well aware of the drawback in connection with zinc, from giving off a lime-like exudation, but it may not be generally known, that if the better brands of zinc are employed, the exudation is only of a temporary character. After a few days in the ground in wet weather, they may seem as if they had been dipped in a box of chalk, but if they are wiped over, the whiteness is easily removed, and so far as my experience goes, though the zinc has a somewhat duller appearance than when new, it continues to be of a sober tone, displaying well the black characters done by metallic ink, chiefly of platinum in solution of proper strength. Your correspondent's statement that the label should be of a light colour is open to question; anyhow, it is a question of taste, and I find most of my friends prefer a quiet-looking tally, and even then many prefer to place the label behind rather than in front of the plant. As to the convenience or otherwise of writing zinc labels for out-of-doors, if the materials are kept handy, they may be written almost as quickly as wooden labels, and when we reflect that they last so much longer, I think a little extra pains should not be grudged. For instance, I have scores of zinc labels that were put in the ground sixteen years ago that can be quite clearly read to-day. How many wooden labels should I have had to write in that time for the one and the same plant so long and faithfully represented by one zinc label? In this view the inconvenience and time expended are against the hastily-written wooden tallies. I must urge that unless your correspondent's label has capabilities for open air use, such as firmness in the ground, resistance of frost action, indelibility of the pencil writing against snow water, which is very different to rain, and many other minor qualities not essential for indoor labels, may not be giving us, as he says he is, a more perfect label than any hitherto produced. *J. Wood, Woodville, Kirkstall.*

GOLD FISH.—In some pools of water existing in brickfields in this neighbourhood, some of them deep, a number of gold fish are to be found, which are of a crossed type, for scarcely any are of a golden colour at first, this tint only showing when the fish are about 2 to 3 inches long, and many always remain of a brown colour. I have, at various times, put some of these small fish into the vinery and Peach-house tanks, and in nearly every case the fishes have changed in colour after being in the tanks for a few months. Some of them have lived and thriven for as long as eight years, but in no case have they multiplied. The tanks are 5 feet deep, 7 feet long, and 4 feet wide. They have a 3-inch hot-water pipe running around the sides, at 2 feet from the bottom, which is heated according to requirements. Sometimes the water above the pipes registers 90°, whilst below them it is 30° lower than this. The fish have therefore a choice of highly-warmed and nearly cold water. When the rain water in the tanks is exhausted, the water from a deep well in the chalk is used. The fish do not seem to mind the change, and the well water is very cold as it enters the tank. The fish are never fed. *E. M., Hants.*

ANEMONE BLANDA.—A charming early spring flower is A. blanda. It varies from purest white to shades of blue, the centre sometimes white—a delicate contrast; whilst flowers may be picked out almost double. The white variety is beautiful; but by far the best is the deep blue form, as the colour is rich, decided, and not washed out. It is interesting to note that the deeper-coloured kinds are less vigorous in growth than the paler varieties. Not only does this Anemone vary in colour, but also in the size and shape of the flowers, and continues in bloom over a long season, lasting until A. apennina flowers, some weeks later. In mild weather, its buds expand even at Christmas. A. blanda is a plant for all good rockeries, and is very hardy and vigorous in growth. *V. C.*

VIOLET, KING OF VIOLETS.—Finding the above-named Violet proved so much hardier than Marie Louise and Comte Brazza, I have worked up a stock of it, and find that by planting in a cold frame it forms a succession to those varieties. In the open the plant stands severe weather, and flowers freely, whereas the other varieties planted alongside have been ruined by the frost. The colour of the King is indigo-blue, and the flowers are very double, and the growth of the plant is dwarf; consequently it may be planted closer together than Marie Louise and other larger growers. I used to plant Violets in all vacant spaces at the foot of walls, but after so frequently losing so many from the frost, I find it better to plant on the borders in the width of the garden, and use frame-lights in bad weather to protect them. *J. H.*

BRITISH AND AMERICAN APPLES.—I note Mr. Evans' reply on above matter. Impossible! No such sudden fall took place in Apple values. Common sense must tell him there is certainly a blunder on some one's part. "December 3: Blenheim and Cox's Orange, 5*s.* 6*d.* per bushel," and "December 9, same sample, 2*s.* 6*d.*, 3*s.*" If Mr. Evans sent his Apples in half bushels, the latter price would be correct, and, I submit, if in bushels, the error is the salesman's, or his clerk's. Individual errors are always possible, but such violent fluctuations in December as recorded for Apples (after being harvested), I have never known during my thirty-five years' experience. Mr. Evans, or the buyer, was sadly taken in, by paying 40*s.* per barrel for Americans, "small size, spotted, and very inferior quality." The whole English growth of Cox's Orange and Blenheims would not nearly be sufficient for one week's supply, and to say it is a fact that one pound of home-grown Apples equals three pounds of imported is a matter that the public disputes. If Mr. Evans depends upon a large and continuous supply by grafting old trees, it is a fair indication that he is not alive to the requirements of the times; not only is he likely to have different kinds in one orchard, but may get them on each tree. All gardeners should know that a tree fifteen years old is in its prime, and should produce fine fruit; but I question if anyone would suggest the bare possibility that it could continue to produce "fine fruit" for fifty years after. Had my theory been adopted soon enough in the past, there would have been no necessity for remarks of this nature now, the result (not "disastrous") would have made us masters of the situation, and all comers could then have been defied. I still say Tasmanian imports need cause no alarm; the 5*s.* per case cost of transit is sufficient to confirm my views; and if, in addition, the cost of the case, paper for each Apple, labour of packing, and value of fruit, besides rail charges to Hobart, are considered, he will, no doubt, accept my statement of 8*s.* as well under the mark for placing them on this market. French supplies had to make way for American (better fruit), at less money; hence the decline in French exports. I did not say English fruit can be seen in many shops displayed in American packages. Mr. Evans will find, on perusal, that my letter stated

"English produce in foreign packages," and as I was then referring to Sir W. Hart Dyke's intended Bill to regulate the sale of foreign produce, I do not quite see why he should assume I referred to Apples. *J. B. Thomas.*

THE WINDSOR BEAN.—I have just received a retail seed catalogue, which gives an engraving of the Harlington Windsor, which is generally acknowledged to be our best type, and the pod contains six Beans! and a curious fact about the picture is, that the Beans actually overlap each other as they lay in the pod, which is most unnatural, and actually opposed to fact. Previous to this, I had seen in a catalogue a pod of a Windsor Bean represented as containing four Beans, which is decidedly unusual. Where the artist got his model pod from is not stated, but he probably evolved it from his own consciousness. But is it not a bit misleading on the part of catalogue-makers to put such pictures in their lists. If any one were to buy of this firm a quart of Harlington Windsor Beans, in the belief that they would get six Beans in a pod, they would be greatly disappointed. Extra good cultivation will sometimes give three Beans in a pod, and occasionally four; but it is a question of selected stocks and high culture. In the case of ordinary garden culture two rather than three in a pod usually holds good. Pictorial representations in catalogues should be a fair representation of the type, and not a fanciful one. *Faba.*

HARDINESS OF EUCALYPTUS GLOBULUS.—The only plant of Eucalyptus globulus I have seen that has stood our winter so far north, is one at Balruddery, near Dundee, the residence of J. M. White, Esq. I believe it was planted twelve years ago, and has never had any protection, beyond being slightly sheltered from the north by a lofty conservatory which it stands near; but unfortunately the winter of 1891–92 proved too severe, as it lost 4 feet of its top. Still, a fine stem of 20 feet remains uninjured, and girths about 18 inches 3 feet from the ground. A fine crop of shoots, 2 to 3 feet long, were thrown out all down the stem last summer, and these have only lost the tips, after being exposed to 23° of frost this winter. *A Ingram, Clapton Nursery, N.E.*

PLUMBAGO CAPENSIS.—I was glad to observe in your issue of the 11th ult. information by two correspondents, in response to "W. D.'s" enquiry, anent this plant as a bedder. As, however, your correspondents' description of the use of this species of Plumbago somewhat differs to that practised for such a long period at Wilton House, Salisbury, as indicated by "W. D.," also that I happen to be the member of the Birmingham Gardeners' Association, permit me to correct a slight mis-statement by "W. D.," and of which, I fear, I was inadvertently the cause. I intended to state the fact that Calceolaria amplexicaulis had been used elsewhere, instead of at Wilton, in connection with the Plumbago, and where, as far as I am cognisant, the latter has always been bedded out in two large beds set apart for it, and without any accompaniment save the light brown stone edging to the beds. When in charge of the flower garden there, upwards of thirty years ago, I used to peg the Plumbago down close to the soil, and spring-struck, as well as old-established plants, bloomed freely alike; and the effect may be more easily imagined than described, when I state that in due course the sheet of the lovely light blue flowers was so perfect, that it was difficult to insert one's hand without touching them. Since then, for several years in succession, when residing in south Warwickshire, I used it with very good effect (though, owing to climatal conditions, not so successfully as at Wilton), and it was there that I employed it in conjunction with divers combinations, the Calceolaria amplexicaulis in question being one of them, mixed, or otherwise. One of the most effective combinations, however, was a mass of the Plumbago margined with either a pale pink Pelargonium or Verbena, and an edging of the chaste and elegant Polemonium cœruleum variegatum, or with the latter alone. Another pleasing effect, on the famous "shot silk" style (Verbena venosa and Mangle's variegated Pelargonium mixed) of good old Donald Beaton, was produced by Plumbago and Mangles' Pelargonium intermixed, the light pink loose trusses of the latter consorting admirably with those of the former. Some years ago I observed this Plumbago used with good effect in Battersea Park. The wonder is that such an easily-managed plant is not universally adopted for the purpose indicated in suitable positions, and it requires no more trouble to winter it than the ordinary bedding plants. As a parallel to the long-continued particular adoption of the Plumbago for such a lengthened period, it may be interesting to add, is to be found, I believe, at Penrhyn Castle, North Wales, in the shape of Rollisson's Purple Unique Pelargonium, and where it has been used as a bedder for upwards of thirty years regularly. It was, however, introduced into the flower garden there upwards of forty years ago, in conjunction with one or two other hybrids of that section, and of which I have a distinct recollection, having been in charge of that department myself, when "trying my 'prentice hand" under the late Mr. John Burn. So many "good things" having cropped up in my memory in connection with the flower garden of yore, must be the apology of my excuse for having thus far intrenched upon your valuable space. *Apropos* of the foregoing notes in connection with the Wilton flower garden, I have thought that it might be interesting to add that there are two paintings by Mr. Philip Burne-Jones on exhibition at the present time in the New Gallery, representative of the Italian Flower Garden, and a small full-length portrait of the Countess of Pembroke upon the steps of the famous Palladian Bridge at Wilton House. *William Gardiner, Harborne, Birmingham.*

FOOTPATHS IN PLEASURE-GROUNDS.—These should surely diverge as much as possible at right angles; in fact, there should be very few exceptions. The acute angle provokes short cuts over what is not intended to be trodden upon. *Will Tayler.* [We do not consider it is fair to criticise a simple ground-plan of a garden or park without having seen the ground and noted its contour, the position of objects, such as trees, shrubs, masses of rock, and others, which may have to remain; and also being made acquainted with the conditions imposed on the landscape gardener by his employer. Ed]

THE MIDDLEMAN.—Without doubt, the very best middleman is the grower himself. Nine-tenths of those who grow largely for market sale, and reside within 20 miles of London, do their own selling in the market. If they did not, very many could not make both ends meet. But then the smaller growers cannot afford to run up to market several times a week and occupy a stand, because their bulks are not of sufficient dimensions to make it pay. Hence, they are compelled to utilise the middleman; and perhaps it is fair to retort on the part of myriads of this class of growers, to Mr. Whitehead Cousins, that they, too, complain bitterly very often, of the difficulty experienced in getting empties returned. It is rather odd to find that the very people who call so earnestly for small holdings and *la petite culture* are those who so strongly denounce the middleman; yet no system of small holdings for fruit, flower, and vegetable culture, can be made at all profitable without his aid. It would be just as reasonable to expect that our town trader could send his goods to customers in all directions without the aid of the carrier, as that the quantities of produce, no matter what, raised on small holdings, could reach consumers without the aid of collectors or middlemen. That is the practice which prevails in France, a vast country of small producers, and they, though only by very hard labour, find it to pay. With respect to existent middlemen, I have inquired of scores of producers for market, both private gardeners, myriads of whom now grow to that end, and of *bonâ fide* market growers, who send to Covent Garden, what are their returns, and they almost always seemed satisfied, expressing the highest confidence in their salesmen. What is the use of falling foul of what is, in these days, an indispensable institution? *A. D.*

NURSERY NOTES.

HARDY FLOWERS AT MESSRS. BARR & SONS, LONG DITTON.

The few days of sunshine in mid-February "brought on" some of the hardy flowers here. The Narcissus, for which the firm is justly famous, are necessarily represented by pale smiles at present. The earliest and smallest of the Narcissi, N. minimus, was noticeable on a recent call, with its rich full yellow flowers. It is excellent for edgings, for rockeries, and pot-culture. That pretty Daffodil, N. cyclamineus, was just beginning to unfold its flowers. Crocuses were to be noticed in great variety. Cyclamen Coum arrested attention with its dark-based bright crimson flowers. Other noteworthy subjects were noted in the beautiful novelty Iris Bakeriana, a lovely and striking species, flowers resembling in form those of I. reticulata; Standard, sky-blue, falls white, blotched, and spotted dark violet. The flower possesses the recommendation of being fragrant. Two other good Irises in flower worthy of note are:—Iris reticulata Krelagei, red-purple, blotched golden-yellow—very fragrant; and I. sophenensis, introduced from Asia Minor; this is a variety of I. reticulata, the flowers of a reddish-purple colour, the falls marked with a yellow line down the centre. It revels in a light spot, where the soil is sandy, and the position sheltered. An interesting variety. The flowers, however, are not so fragrant as those of the type.

The Hellebores were out in full beauty. Chief amongst them were H. punctatus, purple, spotted with a darker colour; and many forms of H. orientalis. These hardy winter-flowering plants are covered with blossoms at a period of the year when plants in flower outdoors are rare. They resist the frost well, their flowers rising fresh and fair after even quite sharp frosts. As flowers for cut purposes, they are specially valuable at this season of the yea , these being well preserved if actually immersed in the water directly they begin to droop.

A fine new rockery is being constructed here under the direction of Mr. W. Barr, who has the management of this branch establishment. This rockery, when finished and planted, will add new interest and variety to this excellent store place of hardy garden plants. *J. B.*

Plants in Flower at Messrs. Backhouse,'s, York.

Perhaps the following remarks and notes of plants in bloom will be of interest to your readers. Owing to February being mild, the number of plants in flower is unusually large; and I have before me a list of them which I will enumerate in the order of their flowering. The first to make its appearance was the Winter Aconite, Eranthis hyemalis, in the last week in January, and it is still in flower. It was followed by Iris Bakeriana, a fine addition to spring-flowering bulbs, and of easy culture; Bulbocodium vernum, or Spring Colchicum, with its purple-lilac flowers, forms quite a mass of pretty colour; Colchicum luteum, with golden Crocus-like flowers; Leucojum vernum, L. carpaticum, Spring Snowflakes. The latter Leucojum differs only from L. vernum in the petals having yellow tips. Then came Galanthus Elwesii, G. plicatus, G. Fosteri, which differs from the others in having broad, deep green leaves, which contrast well with the large white flowers on established plants. The curious Sharlocki should not be omitted, nor Chionodoxa Luciliæ and C. Sardensis, which are both beautiful just now. Chionodoxa Sardensis is a plant of late introduction, and has flowers of much deeper shade of blue than in C. Luciliæ. Anemone blanda and A. blanda alba are just appearing; also Morisia hypogæa, a plant introduced a year or two ago, and as yet little known. Of all the early alpines this is the most beautiful, beginning to flower in January and continuing until May; the little buds which are formed at the axils of each leaf, opening their beautiful golden yellow cardamine-like flowers with the first rays of sunshine. The flowers stand upright, and about 2 inches above the foliage, which lies close to the ground, and resemble a much divided Blechnum spicant frond. Narcissus minimus and N. cylamineus are effective just new. The Crocus family are all beautiful, and I will just mention a few of the best. Crocus alatavicus is the first to open, followed by C. speciosus, C. nudiflorus, C. Aucheri, C. Imperatonius, C. annus? golden-yellow; C. Weldeni, pure white; C. chrysanthus, chocolate and purple; C. leucostigma, lilac-purple, very free; C. lævigatus, violet; C. vernus Leedsii, chocolate and white; and C. Boryanus. The above species of Crocus succeed in light sandy soil. Scilla bifolia,

Hyacinthus azureus, Muscari pallens, Sisyrinchium grandiflorum, and S. grandiflorum var. album, may be seen to perfection at the present time.

Some of the Saxifrages are worthy of note, S. Burseriana multifida being the first to open its blossoms, to be followed by S. Frederici Augusti, sometimes called luteo-purpurea, with its heads of pale primrose-yellow flowers borne upright on stems 3 inches high, with four or five flowers in a head; S. sancta, a very compact-growing plant, with heads of deep orange-yellow flowers; S. Burseriana major, S. B. grandiflora, and S. oppositifolia section are all effective species; S. oppositifolia pyrenaica rubra, varying in colour from deep rose to pure white, being the best. The above are well adapted for the rockery or border, and are hardy.

All of the Hepaticas are fully out now. H. angulosa and its varieties, which vary in colour from delicate soft rose to deep blue; it grows well in either shade or full sunshine. The Hepaticas benefit much if top-dressed with good fresh soil, the plants growing upwards in time, and getting out of the ground.

Helleborus orientalis in variety are effective plants, which range in colour from deep red to pure white—well adapted for growing under trees. Sanguinaria canadensis grandiflora is now showing its buds above-ground, and in a few days it will be like a sheet of snow. Primula marginata and its varieties are very fine, with their lavender-blue flowers contrasting with their beautiful foliage. Primula purpurea, P. minima, Cyclamen Coum, C. vernum, and Fritillaria tristis are all but out. *W. A. C.*

SOCIETIES.

ROYAL HORTICULTURAL.

March 14.—The show on Tuesday last at the Drill Hall, James Street, Westminster, was an exceptionally fine one. Exhibits were so numerous it was with difficulty that they were accommodated, and their general character and quality left little to be desired. Before the lecture by Professor Henslow in the afternoon, sixty new members were admitted to the Society, making a total of upwards of 100 since the beginning of February.

Floral Committee.

Present: W. Marshall, Esq., in the chair, and Messrs. C. T. Druery, H. B. May, R. Dean, C. F. Bause, G. Gordon, R. B. Lowe, C. Jefferies, W. C. Leach, J. Jennings, C. E. Pearson, W. Furze, W. Bain, C. J. Salter, E. Mawley, C. E. Shea, J. D. Pawle, H. H. D'Ombrain, H. Herbst, G. Stevens, J. Watkins, J. B. Pcë, T. Baines, H. Turner, P. Barr, R. Owen, J. Fraser, and J. H. Fitt.

There were many groups of plants in flower, and amongst these was a fine collection of hard-wooded plants exhibited by Messrs. Hugh Low & Co., Bush Hill Park Nurseries, Enfield. Included were Pimelea spectabilis, Boronias megastigma and elatior, Chorozema Lowii, Tremandra ericifolia hirsuta, several varieties of Epacris, Eriostemon linearifolium and E. scabra, Acacia rotundifolia, A. Drummondii, and A. cordata, Darwinia tulipfera, Hibbertia Reedii, &c. All the plants were in good condition.

Messrs. Wm. Cutbush & Son, Highgate, London, N., had a large group of miscellaneous plants, including many of the plants contained in the above collection. Some very well-flowered specimens of Erica Wilmoreana, and some plants of the beautiful Begonia Gloire de Sceaux, were notable, and there were also to be seen some Azaleas, a few Caladiums, Pernettyas in variety, and some plants of the Otaheite Orange in fruit. An interesting group, consisting of sprays of hardy trees and shrubs, inasmuch as they indicate what are at present in bloom in the Royal Gardens, Kew, was sent by the Director of those gardens. They were: Acer rubrum, A. neapolitanum, Amygdalus communis, A. persicoides, Berberis japonica, Cassandra calyculata, Daphne Mezereum, D. m. var. album, Dirca palustris, Erica carnea, E. c. var. alba, Pieris japonica (see fig. 46, p. 325), P. floribunda Forsythia suspensa, Lonicera Standishii, Nuttallia cerasiformis, Parrottia persica (fig. 49), Prunus cerasiformis var. Pissardii, P. divaricata, Pyrus japonica, Ribes sanguineum, R. s. var. glutinosa, Salix caprea × silesiaca, S. cinerea, S. mollissima, Rhododendron altaclerense ×, R. fulgens; R. Nobleanum ×, R. præcox ×, R. Thomsonii, Ribes spectabile, Amygdalus persicoides.

Messrs. Jno. Laing & Son, Forest Hill, sent a group of greenhouse plants, including some Cliveias, Acacias, Ferns, Dracænas, Orchids, &c.

Messrs. J. James & Son, Woodside, Farnham Royal, Slough, had a group of Cinerarias in bloom. The plants were dwarf, and the flowers large and

Fig. 49.—Parrottia persica.

brilliant, which qualities always attend specimens from this establishment.

A group of Dracænas, Caladiums, Lily of the Valley, &c., came from Messrs. E. D. Shuttleworth & Co., Limited, Peckham Rye, and Fleet, Hants, as did also some fine Narcissus blooms, including N. Telamonius plenus, N. Sir Watkin, N. Emperor, N. Nelsonii major, N. maximus, N. rugilobus, N. bicolor Horsfieldii, N. poeticus ornatus, N. Empress, &c. Some Iris reticulata purpurea, Primula marginata, and the delicate-looking Anemone pulsatilla, were included.

Mr. T. S. Ware, Hale Farm Nursery, Tottenham, staged a good collection of hardy flowers, consisting for the most part of Narcissus, that included N. princeps, N. maximus, N. poeticus ornatus, N. Leedsii Circe, N. incomparabilis aurantius, fl.-pl., N. odorus major, &c. Besides these were Iris persica, Fritillaria aurea, Erythronium purpureum, the pretty little Primula marginata, P. verticillata, P. Clusiana, P. glaucescens, Scilla bifolia alba, and many others.

Mr. W. R. Newport, The Model Nursery, Hillingdon Heath, Uxbridge, W., brought a good batch of single Primulas, model white. The habit was good, and the blooms of fair size. Cyclamens were from Mr. J. Odell, Gould's Green, Hillingdon, who had a large number of well-flowered, good habited corms—Crimson Queen, Giant White, Snowflake, and C. Rosetta, are good varieties in the respective colours.

Messrs. Paul & Son, Cheshunt, in a collection of herbaceous plants (Silver Banksian Medal), included the following:—Hepatica triloba, H. t. rubra and H. t. alba, Saxifraga Boydi alba, S. Burseriana hybrida, S. oppositifolia major, Sisyrinchium grandiflorum, Scilla bifolia, Anemone pulsatilla, Draba Haynaldi, Megasea Stracheyi, and Scopolia Fladnichiana, which was awarded a First-class Certificate. This species as shown grows about 10 or 12 inches high, and produces small yellow tubular flowers. Some Hippeastrums came from the same nursery, including some good seedlings. An Award of Merit was given for H. Salvator Rosa, a very large flower, with wide petals, colour blood-red, with white mark in the centre of each petal. Also some Roses, Teas and H.P.'s in pots, which were much admired.

Messrs. Wm. Paul & Son, Waltham Cross, Herts, staged a wonderful collection of Camellias, in sixty or seventy varieties. The blooms had been taken off with part of the stem attached, and were exhibited in boxes of moss, three or four of each variety. Also a plant of their Tea Rose Corinna, exhibited as a new forcing Rose.

Messrs. Jas. Veitch & Son, Chelsea, exhibited a number of first-rate Hippeastrums, of which the following received Awards of Merit:—Socrates, a very handsome flower, of good colour, only a trace of green visible. Eldorado, a distinct variety, in which the centre lower petal is longer, and tongue-like—colour dark crimson, with short green ribs. Corinna is another advance in colour; it is dark velvety-crimson, and no sign of green whatever in the flower. Excellent is a short flower with wide petals; colour bright scarlet, with white band in centre of each petal. Nimrod was the largest of those shown, an immense flower of good crimson, with green veining in the base of tube only. The same firm contributed sprays of Corylopsis pauciflora, a hardy species from Japan, producing small yellow flowers.

A basket of blue Primroses, very attractive and pretty, were sent by G. F. Wilson, Esq., Weybridge and Wisley, described by him as being about fifty descendants of Scott Wilson, of different shades of blue, plum-blue, lavender, &c.

The Viscountess Hambledon, Greenlands, Henley-on-Thames, showed a plant of Hippeastrum Greenland Gem, carrying four very fine blooms.

The Duke of Northumberland, Albury Park, sent sprays of Deutzia crenata flore-pleno in bloom; and Mr. J. Douglas some cut blooms of Cineraria (Votes of Thanks).

A very pretty group of winter-flowering Begonias was contributed by Sir Trevor Lawrence, including the new showy Begonia Triomphe de Lemoine, most flowery specimens, none more than 1¼ feet high. Backing this lot was a number of finely-flowered of the well-known B. nitida, not showing to advantage by their contiguity to the novelty, sweet-scented, but straggling in habit.

Some large plants of Cliveia miniata and Amaryllis aulica were from Mr. S. G. Lutwyche, Oakfield, South Eden Park, Beckenham; gr., Mr. J. A. May (Silver Banksian Medal). Mr. C. Holden, 61, Warwick Road, Ealing, had a group of plants, including Azaleas, Camellias, a few Ferns, &c.; and a basket of Neapolitan Violets came from Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esher.

M. C. Bruggman, Ville Franche sur Mer, Alpes Maritimes, exhibited two varieties of Chrysanthemum frutescens, C. f. Alma Bruggman, with rays of white suffused with yellow, and others with yellow rays.

Messrs. P. Barr & Sons, King Street, Covent Garden, London, showed a lot of Chionodoxa Sardensis, C. Luciliæ, Scilla bifolia, all beautifully bloomed, also Iris stylosa, I. reticulata, a quantity of early-flowering Narcissus; the best, or rather more advanced, being Ard Righ and obvallaris.

Other exhibits were Helleborus punctatus, and boxful of growing plants of Sisyrinchium grandiflorum album, a plant with grass-like leaves, more than 1 foot high, and dirty-white flowers, borne singly on stalks that slightly overtop the foliage.

Messrs. J. Veitch & Sons, Chelsea, showed a plant of Rhododendron Early Gem, with pale purple flowers; it was entirely covered with flowers, and measured 3 feet in height, and the same in diameter.

Scattered amongst Messrs. B. S. Williams & Sons' excellent contribution of Orchids were the following plants:—Anthurium Scherzerianum Rothschildianum in two examples, one differing from the usual form by a whiter ground, and the scarlet spots arranged in groups on it instead of being regularly distributed; A. Sanderianum, with deep crimson spathe and greenish-yellow spadix; Caraguata cardinale, a remarkable decorative Bromeliad, with broadly-channeled green, semi-pendent leaves, and a bright crimson tuft in the centre; Amaryllis Ophelia, a strong grower, the flower with crimson flames on a greenish-white ground; it is distinct. Cliveia Scarlet Gem, a closely-set, many-flowered head of bright orange-scarlet flowers. A form of Dracæna congesta var. robusta had semi-drooping green foliage. Some fine Amaryllis (Hippeastrum), and the white form of Anthurium Scherzerianum completed this exhibit.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; Messrs. J. O'Brien, S. Courtauld, J. B. Haywood, F. Sander, J. Douglas, W. H. White, E. Moon, J. T. Gabriel, H. M. Pollett, T. W. Bond, H. Williams, E. Hill, T. Statter, W. B. Latham, G. R. le Doux, and Dr. M. T. Masters, F.R.S.

There was a very fine show of well-arranged Orchids from amateurs and nurserymen. The group from Sir Trevor Lawrence, Bart., Burford (grower, Mr. W. H. White), was very attractive, by reason of a number of rare and beautiful species, notably a grand form of Odontoglossum Ruckerianum splendens (Award of Merit), Cypripedium Rothschildianum, the finely-coloured Dendrobium nobile Tautzianum, the pale D. n. Murrhinianum, D. signatum, D. Findlayanum, D. cheltenhamense ×, Cypripedium Dautheri "The Albino," with whitish-green flowers; the pretty Maxillaria sanguinea, with numerous flowers, with white labellum, having a crimson-coloured base, and the elegant little South African terrestrial Orchid, Tryphia orthoceras, with many neat sprays of white and lilac flowers (Botanical Certificate).

Messrs. F. Sander & Co., St. Albans, also had a group of rare Orchids. Dendrobium nobile Ballianum, blush-white flowers being unique (First-class Certificate). Phalænopsis Stuartiana, St. Albans variety, had very large flowers; Cœlogyne Sanderæ had snow-white flowers, with ample fimbriated yellow and red labellum—a very charming species (First-class Certificate). Also in the group were good examples of Vanda teres, with blush-white flowers; the rare Oncidium Brunleesianum, Dendrobium Kingianum, several D. luteolum, the new hybrid Phaius amabilis, Dendrobium nobile Cooksoni, Cypripedium caudatum Wallisii, some good Lycaste Skinnerii, &c.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., had an extensive group, in which the species and varieties of Cypripediums were very fine; among them were C. × Ceres var. (Spicerianum × hirsutissimum), with grand flowers; C. Williamsii ×, C. Pitcherianum × Williams' var., C. P. striatum ×, C. Morganiæ ×, C. insigne Fostermanni, C. Elliotianum, C. Peetersianum ×, C. Boxalli nigrum, C. B. marginatum, &c. Also specially good were Cœlogyne cristata alba, Cattleya Trianæ quadricolor, Cymbidium eburneum, Dendrobium nobile Cooksonii, Lycaste costata, varieties of L. Skinneri, the singular L. gigantea viridis, and an excellent lot of Odontoglossums.

Walter Furze, Esq., Roselands, Teddington (gr., Mr. E. Coombs), staged an excellent group of well-grown showy Orchids, the specimens of Dendrobium Wardianum being very remarkable; so also were the varieties of D. nobile, D. crassinode, D. superbum, D. Findlayanum, Cypripedium Lathamianum ×, and many other Cypripediums; Cattleyas, Cœlogynes, Odontoglossums, &c., the whole arranged with great skill.

Messrs. Hugh Low & Co., Clapton, had a small group of Orchids, among which were the pretty Cypripedium × De Witt Smith (Spicerianum × Lowii), C. callosum, Low's var., and the pretty clear yellow Bulbophyllum Sillemianum.

J. Foster Alcock, Esq., Berkhamsted, showed Cypripedium Schroderæ × with three strong spikes; C. vernixium ×, Lælia anceps Stella, Cœlogyne cristata alba, Cattleya Harrisoniæ violacea, and a very fine Cypripedium Elliottianum.

A small group of Odontoglossums came from C. J. Lucas, Esq., Warnham Court, Horsham, gr. Mr. Duncan; and a similar exhibit, in which a singular hybrid between O. Corradinei and O. Wilckeanum was conspicuous, from W. Thompson, Esq., Walton Grange, Stone, Staffordshire, gr. Mr. W. Stevens.

From the gardens of Baron Schroder, The Dell, Egham, gr. Mr. H. Ballantine, came the most novel hybrid in Lælia × vitellina, a beautiful variety, supposed to be out of L. harpophylla. The growth of the plant was like that of a small L. Perrinii, and it bore a single flower some 5 inches across, and almost entirely of a rich orange-tinted Indian yellow. It will doubtless produce more flowers on an inflorescence, and will be a very handsome hybrid.

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester, gr., Mr. R. Johnstone, exhibited a noble plant of Lycaste Skinnerii alba, bearing nine very large flowers from one leading bulb, the plant being wholly unaffected by the effort; also Dendrobium nobile nobilius, and D. n. virginalis.

F. Wigan, Esq., Clare Lawn, East Sheen, grower, Mr. W. H. Young, showed a splendid specimen of Cœlogyne pandurata, Megaclinium falcatum, and Masdevallia Vespertilio.

Messrs. Jas. Veitch & Son, Chelsea, sent Dendrobium × Euryalus (D. × Ainsworthii ♀, D. nobile ♂), D. × Æneas (japonicum ♀, crystallinum ♂), Epidendrum Endresio-Wallisii ×, and the richly-coloured Epiphronitis Veitchii ×. Messrs. Fred. Horsman & Co., Colchester, showed Lycaste Skinneri "Hettie," a beautiful form like a L. S. alba, but tinted with carmine on the lower parts of the petals, and with a pink tinge over the sepals.

Messrs. Pitcher & Manda, The United States Nurseries, Hextable, showed two plants of Cattleya Trianæ Smithii, an exceptionally richly-coloured flower. G. R. le Doux, Esq, Langton House, East Moulsey (gr., Mr. B. Bowyer), showed Cypripedium Ledouxii × (callosum × Harrisianum) somewhat resembling C. œnanthum ×, and with the dorsal sepal almost entirely of a purple colour. Among other exhibits from Mr. le Doux were also Cattleya Trianæ Ada le Doux, and some good varieties of Odontoglossum triumphans. Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne, exhibited his Cypripedium × Bryani, previously certificated.

S. G. Lutwyche, Esq., Oakfield, Beckenham (gr., Mr. J. A. May), sent a small plant of Dendrobium Devonianum candidulum. A. H. Smee, Esq., The Grange, Carshalton (gr., Mr. Cummins), showed a fine spike of Cyrtopodium punctatum Saintlegerianum. Walter C. Clark, Esq., Sefton Park, Liverpool, sent a magnificent spike of a fine form of Cymbidium Lowianum, with twenty-three flowers, the colour on the labellum nearly scarlet. Reginald Young, Esq., Sefton Park, Liverpool, sent a flower of a form of Cattleya Trianæ, with rich bright amethyst-crimson lip.

Messrs. John Laing & Sons, Forest Hill, again showed their Dendrobium crassinode giganteum. H. Shaw, Esq., Ashton-under-Lyne, sent flowers of Maxillaria Sanderiana and of a Dendrobium. Lord Foley sent for name Cœlogyne flaccida. W. Soper, Esq, Clapham Road, S.W., sent Odontoglossum Rossii, Sophronitis grandiflora, &c.

Messrs. Linden, l'Horticulture Internationale, Parc Leopold, Brussels, showed Phalænopsis Aphrodite (amabilis), Linden's var., in which the crimson colour seen at the base of the lip in ordinary forms was wanting. From the Royal Botanic Gardens, Glasnevin, Dublin, F. W. Moore, Esq., the Curator, sent flowers of Aërides platycheilum and Lycaste xytriophora; and Mr. Chas. Vuylsteke, Loochristi, Ghent, exhibited a very singular little Odontoglossum, probably a form of O. blandum.

Fruit Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. T. F. Rivers, Harrison Weir, W. Wilks, J. Cheal, C. Ross, G. Goldsmith, G. T. Miles, G. W. Cummins, A. Dean, J. Wright, T. J. Saltmarsh, J. A. Laing, W. Bates, H. Pearson, G. H. Sage, E. Burrell, G. Wythes, H. Balderson, J. Hudson, J. Smith, G. Norman, G. Bunyard, and J. Willard.

Mr. S. Hardy, Ash House, Parson's Green, S.W., exhibited a large quantity of Mushrooms in various stages of growth, solid and good. He also exhibited photographs of Mushroom-beds in bearing, besides furnishing an account of materials employed in the last six months, and the weight of Mushrooms gathered this year, the list amounting to 3764 lb. (Bronze Knightian Medal). Some Bon Chretien Pears, Melons, coarse-fleshed, but passable as to flavour, and therefore acceptable at this season; and some vineyard Grapes, red and green, were shown by Messrs. Draper & Co., Covent Garden, being part of a consignment from the Cape.

As examples of good late-keeping Grapes, Mr. Smythe, gr., Basing Park, Hants, sent bunches of Black Alicante, Mrs. Pince Muscat, and Lady Downes', all in a well-conserved condition for this late part of the season.

From the Royal Gardens, Frogmore, there were shown a dish of new Grapes of fairly edible quality cut from Vines started on November 1.

A prolific, small-ribbed variety of Tomato, named Ladybird, came from Mr. Leach, gr., Albury Park, Surrey. It appears to set its fruits very freely, a matter of consideration in a winter Tomato (Vote of Thanks).

Some seedling Apples of no recognised merit came from Messrs. W. Young, C. Ross, and Messrs. T. F. Rivers.

Mr. Miller, Lord Foley's gardener, Ruxley Lodge, Esher, showed a box of La Grosse Sucrée Strawberry, ripe, and well coloured.

List of Awards.

Floral Committee.

First-class Certificate.

To Caraguata cardinale, from Messrs. B. S. Williams & Son, Holloway.

To Corylopsis pauciflora, from Messrs. J. Veitch & Sons, Chelsea.

Award of Merit.

To Fritillaria aurea, from Mr. T. S. Ware, Tottenham.

To Hippeastrum Corinna, from Messrs. J. Veitch & Sons, Chelsea.

To Hippeastrum Excellent, from Messrs. J. Veitch & Sons, Chelsea.

To Hippeastrum Nimrod, from Messrs. J. Veitch & Sons, Chelsea.

To Hippeastrum El'dorado, from Messrs. J. Veitch & Sons, Chelsea.

To Hippeastrum Socrates, from Messrs J. Veitch & Sons, Chelsea.

To Begonia Triomphe de Lemoine, from Sir Trevor Lawrence, Dorking.

To Amaryllis Salvator Rosa, from Messrs. G. Paul & Son, Cheshunt.

To Scopolia Fladnichiana, from Messrs. G. Paul & Son, Cheshunt.

To Chrysanthemum frutescens Alma Brüggemann, from Mr. C. Brüggemann, Villefranche-sur-Mer, France.

To Cliveia Scarlet Gem, from Messrs. B. S. Williams & Son, Holloway.

Medals.

Silver Flora.

To Messrs. W. Paul & Son, Waltham Cross, for a Collection of Cut Camellias.

To Mr. T. S. Ware, Tottenham, for a Collection of Hardy Flowers.

To Messrs. Hugh Low & Co., Clapton, for a Group of Miscellaneous Greenhouse Plants.

To Messrs. Cutbush & Son, Highgate, for a Group of Mixed Plants.

To Messrs. J. Laing & Sons, Forest Hill, for a Group of Greenhouse Plants.

To Mr. John Odell, Gould's Green, Hillingdon, for a group of Cyclamens.

Silver Banksian.

To J. C. Tasker, Esq., Middleton Hall, Brentwood, Essex (gr., Mr. J. Perry), for a group of pot Roses.

To Mr. W. R Newport, The Model Nursery, Hillingdon Heath, Uxbridge, for a group of Primulas.

To Mr. C. Holden, 61, Warwick Road, Ealing, for a group of Plants.

To Messrs. J. James & Son, Farnham Royal, Slough, for a group of Cinerarias.

To Messrs. E. D. Shuttleworth & Co., Peckham Rye, for a group of miscellaneous plants.

To Messrs. Paul & Son, Cheshunt, for a group of herbaceous plants and Amaryllis.

To S. G. Lutwyche, Oakfield, South Eden Park, Beckenham, for a group of Amaryllis and Clivias.

Bronze.

To Messrs. Barr & Son, Covent Garden, for a group of hardy flowers.

To Messrs. E. D. Shuttleworth & Co., Fleet, Hants, for group of cut flowers.

To Sir Trevor Lawrence, Dorking, for a group of winter-flowering Begonias.

Vote of Thanks.

To the Director, Royal Gardens, Kew, for a collection of cut flowers of hardy shrubs.

To Lord Foley, Ruxley Lodge, Esher (gr., Mr. Miller), for a basket of Neapolitan Violets.

To Mr. J. Odell, Hillingdon, for Cyclamen Peculiarity.

To Mr. Douglas, Great Gearies, Ilford, for cut blooms of Cinerarias.

Orchid Committee.

First-class Certificates.

To Messrs. F. Sander & Co., St. Albans, for Dendrobium nobile Ballianum.

To Messrs. F. Sander & Co., St. Albans, for Cœlogyne Sanderæ.

To Messrs. F. Sander & Co., St. Albans, for Lælia × vitellina.

Awards of Merit.

To Messrs. Fred. Horsman & Co., Colchester, for Lycaste Skinneri var. "Hette."

To Sir T. Lawrence, for Odontoglossum Ruckerianum splendens.

To Sir Trevor Lawrence, for Maxillaria sanguinea.

Cultural Commendation.

To F. Wigan, Esq., Clare Lawn, East Sheen, for Cœlogyne pandurata.

To T. Statter, Esq., Stand Hall, Manchester, for Lycaste Skinneri alba.

Botanical Certificate.

To Sir Trevor Lawrence, for Tryphia orthoceras.

Silver Flora Medal.

To W. Furze, Esq., The Roselands, Teddington, for a Group of Orchids.

Silver Banksian.

To Messrs. F. Sander & Co., St. Albans, for a Group of Orchids.

To Sir Trevor Lawrence, for a Group of Orchids.

To Messrs. B. S. Williams & Son, Upper Holloway, for a Group of Orchids.

FRUIT COMMITTEE.

Bronze Knightian Medal.

To Mr. S. Hardy, Ash House, Parson's Green, for Mushrooms packed for market.

Cultural Commendation.

To Mr. Smythe, The Gardens, Basing Park, for late-keeping Grapes.

Lecture.

ON SOME EFFECTS OF GROWING PLANTS UNDER GLASS OF VARIOUS COLOURS.

Rev. G. Henslow, M.A., F.R.S., &c., commenced with the observation that light is obviously necessary for ordinary plant life, as evidenced by the blanching of Celery and Seakale in darkness. The question, whether light was favourable or not for the first stage of germination or "sprouting," had not been answered uniformly by observers. Thus, Adrianowski found that the proportion of seeds which sprouted in twenty-four hours in light and darkness was as one to four; but Crislar could not find any advantage in darkness, while Panchon seemed to think it was a matter of indifference. In the latest experiments in 1889, conducted at the Agricultural Experiment Station of the Cornell University, it was found that of Papaver Rhæas seeds, 56 per cent. sprouted in light, while 74 per cent. did so in darkness; the former were also very much slower. Of Larkspur (dwarf Rocket), 0 per cent. sprouted in light, and from 20 to 30 per cent. in darkness. Of Adonis æstivalis, 4 per cent. sprouted in light, 68 per cent. in darkness. Lastly, of two lots of Radishes, 91 per cent. sprouted in light, 71 per cent. in darkness, in one case; 82 per cent. in light and 92 per cent. in darkness, in the other. M. Panchon found that the influence of light varied with the species; badly nourished and oily seeds, as well as those with dark skins, being favoured by it. The question, however, does not seem to have much practical importance, unless any conclusion can be drawn from the case of the Larkspur mentioned above.

With regard to green plants, Mr. Henslow described the nature of the solar, and showed how certain bands of light are absorbed when passed through a solution of chlorophyll. The rays of light thus taken up by the green colouring matter of plants are believed to be the active agents in promoting the great functions of transpiration, or the giving off vapour of water, and assimilation, or the absorption of carbonic acid gas and the giving off of oxygen into the air, while the obscure heat rays favoured respiration, or the absorption of oxygen and the expiration of carbon dioxide. After describing these processes and their importance in plant-life, Mr. Henslow referred to his experiments of growing plants under coloured glasses. The general conclusions derived from them were that transpiration was most active under red and violet, and slightly so under green, while assimilation was most effective under yellow, blue and clear glasses. This result was somewhat unexpected, as M. Dehérain thought that the same light, i.e., as absorbed by the chlorophyll bands, was effective for both processes. Looked at from a practical point of view, every coloured glass, as well as ordinary clear glass, is injurious for plants of a temperate climate, though yellow and blue are the least so for assimilative purposes. Green is pre-eminently bad. Dr. Lindley, in his *Theory of Horticulture* pointed out the uselessness of making the Palm-house at Kew of green-tinted glass, as was done at the suggestion of Mr. Hunt, and the experiment of glazing the Fern-houses with green glass has proved the inefficiency, or rather injury resulting from it. Several experimenters have thought that a violet light was useful for forcing, and that seeds germinate quicker; but from Adrianowski's experiments, it appears that total darkness is best. Again, a certain florist is accustomed to hasten crowns of Lily of the Valley by growing them in a violet-glazed house with a due arrangement of the heating apparatus; by this means, I am informed, they blossom fourteen days in advance of others. More experiments are required in this direction; but for all plants with green foliage, no other than the free light and air of the open ground is to be preferred. Plants are naturally attuned to receive all the rays of the spectrum, and if any one or more be wanting, the plant will suffer proportionately. Hence, all kinds of artificial lights can never be equal to that of the sun.

MANCHESTER BOTANICAL AND HORTICULTURAL.

March 14.—The first of the spring flower shows promoted by the Botanical and Horticultural Society for the current season was opened on the above date at the Town Hall, and remained open till 4 o'clock on Wednesday. The wealth of gay blossom displayed was such as could not fail to astonish, and the variety of kind in the plants left nothing to be desired. We have seen larger and more imposing examples of Orchids, but never, that we remember, any that better satisfied the requirements of a cultivated taste. Mr. Hardy's lot was exceptionally meritorious in regard to the diversity of the forms.

Mr. E. Wrigley's was a beautiful exhibit. Mr. G. B. Ball, Bowdon, limited his exhibit to Dendrobiums of much excellence. Mrs. J. M. Bennett showed Cœlogynes, and Mr. W. R. Lee, Audenshaw, Dendrobiums. Messrs. Charlesworth, Shuttleworth & Co., Clapham and Bradford, contributed a select and brilliant lot of Orchids.

It would be difficult to imagine anything that could surpass Messrs. R. P. Ker & Sons' Hippeastrums (Gold Medal), crosses or varieties raised by themselves at Aigburth. In contrast to the scarlet of the Hippeastrums, and confronting them, stood what it is always a treat to see, Messrs. Dickson's Daffodils and other Narcissi from Chester, arranged, as heretofore, fanwise. Messrs. Dickson, Brown, & Tait show their skill in Hyacinths.

Of groups of miscellaneous plants, there were two. Messrs. Clibran, of Altrincham, sent one, consisting of all the greenhouse gems of the season, including also some Echinocacti. The other group, occupying the entire space below the organ, was from the gardens at Old Trafford, a splendid display of Cliveias conferring emphasis. Mr. Samuel Barlow sent an astonishing series of seedling varieties of the Chinese Primula, illustrating his belief that by perseverance with cross-fertilising he will succeed at last in obtaining that great desideratum with florists, a pure sky-blue, though never yet seen in P. sinensis.

Lastly, Mr. R. P. Gill, Ashton-upon-Mersey, sent a beautiful set of the Primula marginata; Mr. Samuel Allan, of Sale, Orchids and Ferns; Mr. Brownhill, of Sale, a white Carnation, very pretty; and Mr. Joseph Broome, some forty posies of hardy flowers from Llandudno, a miracle of vernal beauty. Cultural Certificates were awarded by the committee to Messrs. Ker and Messrs. Dickson.

TRADE NOTICE.

Mr. A. Cole, for eleven years head gardener to Joseph Broome, Esq., Sunny Hill, Llandudno, has gone into business in company with his son at Pantyffynon Nurseries, Llandudno.

ENQUIRIES.

"He that questioneth much shall learn much."—Bacon.

Hollow Potatos.—What is known as to the mode of production of the cavity occasionally met with in the centre of Potato tubers? *Alnwick.*

Evac would like to know if the following is a fact:—"I have heard it stated many times lately, that the land of Palestine, once so fertile, has for centuries been unproductive, owing to the absence of the rain necessary for the maturation of the crops (termed the 'latter rain'). Further, that for the last few years, the rain has fallen with increasing copiousness, thereby ensuring a repetition of the ancient productiveness. Is this so? And is there a prospect of that country becoming a field for western enterprise and capital in the immediate future?"

Kirkstall Abbey Grounds.—At a meeting of the Corporate Property Committee of the Leeds Corporation, it was resolved to pay the first premium of £20 to Messrs. J. Cheal & Sons, landscape gardeners, of Crawley, Sussex. The design submitted by this firm has many fine features, and when carried out, will render the Abbey and its grounds an attractive resort. The carrying out of this design will involve an estimated expenditure of £3000. The second premium of £10 was awarded to Mr. T. H. Mawson, of Windermere.

Obituary.

Rev. Dr. Woolls.—A Dalziel special telegram, dated Sydney, March 14, says:—The death is announced of the Rev. Dr. Woolls, one of the most respected of old colonists. He left England for Sydney in 1831, and was the author of *A Contribution to the Flora of Australia*, and numerous other works. In 1873 he took orders in the Church of England."

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Above (+) or below (−) the Mean for the week ending March 11.	Temperature. Accumulated. Above 42°, for the Week.	Below 42°, for the Week.	Above 42°, difference from Mean since January 1, 1893.	Below 42°, difference from Mean since January 1, 1893.	Rainfall. More (+) or less (−) than Mean for the Week.	No. of Rainy Days since Jan. 1, 1893.	Total Fall since Jan. 1, 1893.	Bright Sun. Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 1, 1893.
		Day-deg.	Day-deg.	Day-deg.	Day-deg.	10ths Inch.		Ins.

*	3 +	41	0	+ 57	− 23	4 −	51	7·2	52	27

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending March 11, is furnished from the Meteorological Office:—

"The *weather* during this period was fine, mild, and spring-like, in nearly all parts of our Islands. In the north and north-west of Scotland, however, it continued unsettled, and some heavy rain was experienced.

"The *temperature* was decidedly above the mean, the excess ranging from 3° in the 'Channel Islands' and 'England, S.W.,' to as much as 5° or 6° in most other districts; and to 8° in 'Scotland, E.' The highest of the maxima were registered on the 8th, when the thermometer rose to 66° in 'England, E.,' and the 'Midland Counties,' and to 63° in 'England, S.,' while in other districts the maxima ranged from 60° in 'Scotland, E.' and 'England, S.W.,' to 56° in 'England, N.W.,' and the 'Channel Islands.' The lowest of the minima were recorded towards the end of the week, and ranged from 37° in 'Scotland, W.

and 35° in 'England, N.E.,' and the 'Channel Islands,' to 28° in 'England, S.,' 27° in 'England, S.W.,' and 26° in the 'Midland Counties.' The diurnal range of temperature was large generally, especially during the latter half of the week.

"The *rainfall* exceeded the mean in 'Scotland, N.,' but showed a great deficit in all other districts. Over the greater part of England and Ireland, the fall was less than five-hundredths of an inch.

"The *bright sunshine* was more prevalent over the Kingdom generally than it has been for many weeks past, and exceeded the mean in nearly all districts. The percentage of the possible duration ranged from 16 in 'Ireland, N.,' and 18 in 'Scotland, N.,' to 39 in 'England, E.,' 44 in 'England, S.,' and 52 in the 'Channel Islands.'"

Answers to Correspondents

Address Wanted: The editor of *Gardeners' Chronicle* would be glad of the present address of Mr. C. Young, formerly of Wilton Terrace, Middleton, Manchester.

Carnations Diseased: *T. C.* The Carnation leaf disease, Helminthosporium echinulatum, figured in *Gardeners' Chronicle*, August 21, 1886. Pick off and burn every affected leaf.—*Das.* The plants are affected with the Carnation disease, and the best thing to do with them is to burn all so affected. Spores of fungus may be present in the sand, but not necessarily. Move the cuttings as soon as they have formed roots; and do not put in Verbena cuttings too deep, say, at the most 1 inch. We are sorry your last communication went astray.

Central Garden and Allotment Holders' Association: *W. A. B.* We are not acquainted with it.

Correction: Apple Atalanta. We are informed by Messrs. Cheal & Sons that this variety received an Award of Merit on the occasion of its being first shown, at one of the meetings of the Royal Horticultural Society, and not a First-class Certificate, as was stated in our note in last week's issue.

Hyacinth: *A. S.* The production of five spikes from one bulb is not very uncommon. It arises from the development of axillary bulbs.

Impoverished Lawn: *S., Clapham Common.* The best dressing for the lawn at this season is finely-sifted loam, rotted manure, and wood-ashes or burnt garden refuse. The whole should be put through a sieve with a half-inch mesh. Two dressings would be best, the second being put on when the first has been washed down to the roots; neither should be sufficient to hide the grass from view, and the roller should be industriously plied in dry weather after the dressings are applied. Nitrate of soda dressings (two or three) in the course of the summer would do good if afforded at the rate of 2 lb. per square rod; also fish manure—a little heavier dressing; but this last has an evil smell for some time after its application. Where there are bare places on the lawn, shovel the old soil away to a depth of 2 inches; add some heavy loam, tread it firmly, and sow a mixture of lawn grasses, not forgetting some Italian Rye-grass and Trifolium minus or T. repens. Having sown the seed, rake it into the loam, or sprinkle soil lightly over it, and roll, or pat the surface with a piece of board or the spade. Clover is best sown thinly before the grass seed.

Insect: *An Anxious One.* The large "scale" is Lecanium persicæ, peculiarto the Peach, out of doors and under glass. One or two may have remained undetected when the plants were acquired. The treatment adopted is good; but attention should be especially directed to the very young small scales as well as to those which are large and conspicuous. *R. McL.*

Names of Fruits: *C. K.* Your Apples are so much discoloured, that any attempt at naming them would be merely hap-hazard. You should have sent earlier.

Names of Plants: *R. C. T.* The Cattleya is, as you suggest, C. guttata Prinzii (C. amethystoglossa).—*J. J. W.* You have greatly exceeded the limit of six at a time, but we will do the best we can for you. The species are correct, but the varieties are so numerous that we cannot be sure about them. 1, N. Telamonius plenus; 2, N. Telamonius plenus; 3, N. Pseudo-Narcissus; 4, N. incomparabilis; 5, N. odorus; 6, N. bicolor; 7, N. papyraceus; 8, incomparabilis (Butter and Eggs); 9, N. incomparabilis, double; 10, N. maximus; 11, N. cernuus; 12, N. Pseudo-Narcissus; 13, N. bicolor; 14, N. Macleaii; 15, N. major, double; 16, N. Pseudo-Narcissus; 18, incomparabilis var.; 19, hybrid from incomparabilis; 20, hybrid from incomparabilis; 21, hybrid from incomparabilis; 22, N. incomparabilis; 23, N. odorus; 25, Sisyrynchium bermudianum.—*T. C. J. R.* 1, Saxifraga oppositifolia; 2, Scilla bifolia; 3, Primula marginata; 4, 5, not found; 6, Chionodoxa Luciliæ; 7, Iris reticulata.—*G. McA.* Stenotaphrum mexicanum variegatum; Chlorophytum Sternbergianum, the green-leaved one.—*W. A.* 1, Dendrobium Cambridgeanum; 2, Oncidium divaricatum.—*A. C.* The Cattleya is very distinct, we may refer to it again. The Dendrobium is a very fine form of D. Wardianum.—*C. B. L. S.* Oncidium received; many thanks. Will refer to it again.—*T. H.* 1, a form of O. Andersonianum; the other Odontoglossums are all forms of O. crispum; the others, Vanda suavis and Dendrobium Wardianum.—*W. A. Lancaster.* 1, Dendrobium nobile near to D. n. Ballianium, described at p. 322; 2, Odontoglossum Corradinei.—*H. G. B.* 1, Dendrobium Pierardi; 2, Passiflora racemosa, 3, Aponogeton distachyon; 4, Hottonia palustris (Water Violet); 5, Davallia bullata; 6, Marattia alata.—*C. W. D.* Next week.—*D.* We found no Ferns, but only the bulbs of what we take to be Alopecurus bulbosus.

Plants for a Plot on a Lawn where Grass will not Grow:—*S., Clapham Common.* Vinca major and V. minor, Periwinkles, height 8 to 12 inches; plant about 15 inches apart for the first-named, and 10 inches for the latter. Hypericum calycinum, St. John's Wort, less than 1 foot high—may be cut over each spring, and this constant cutting helps to render the plant dwarfer than its natural stature; plant as for Vinca major. Sedum elegans, S. ibericum, S. pulchellum, if planted in patches, would do well in the sandy soil, and give an interesting feature; and you could plant Lilies, Iris, Gladiolus, and other bulbs amongst them. Gentiana verna, in big patches, would be green all the year round, besides affording masses of lovely blue flowers. Whatever is planted, the soil should have a heavy dressing of rich loam forked into and intimately mixed with the staple.

Preserving Specimens: *Sy.* Spread the leaves, stems, flowers, &c., in their natural positions between sheets of blotting-paper, under considerable pressure, changing these sheets once a week, or oftener, in the case of thick, sappy subjects, until dry; then fasten them on to sheets of herbarium-paper by means of narrow strips of paper and gum arabic. If numerous specimens are being dried, it is better to make several piles, they will then dry quicker.

Raisins: *W. S. E.* Grow the seedlings on in vinery warmth till the wood shows signs of maturing, i.e., becoming slightly brown in colour towards the base of the stem, when the plants might be placed out-of-doors against a sunny hedge or wall. Whilst growing, the plants should be trained on rods, or pieces of wire, within 15 inches of the roof of the glasshouse. Probably the Grapes will turn out to be of very ordinary quality.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 *words, including name and address,* 1*s.* 6*d.*, *and* 6*d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.*

Births, Deaths, and Marriages, 5*s. each insertion.*

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No.* 42, *DRURY LANE, to* A. G. MARTIN, *as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST *reach the Office not later than Thursday noon.*

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 *months,* 15*s.*; 6 *months,* 7*s.* 6*d.*; 3 *months,* 3*s.* 9*d. All Foreign Subscriptions, including Postage,* 17*s.* 6*d. for* 12 *months. Post-office Orders to be made payable at the Post-office,* 42, *Drury Lane, W.C., to* A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

THE FRUIT GARDEN of the UNIVERSE.—THE AUSTRALIAN IRRIGATION COLONIES (Chaffey Brothers), established and regulated by Government, OFFER an enjoyable life and OCCUPATION, a sunny and salubrious climate, and most highly remunerative returns to Cultivators with small or large capital; pamphlet free.

CHAFFEY BROTHERS, Limited, 35, Queen Victoria Street, London, E.C. J. E. M. Vincent, Chief Commissioner.

MARKETS.

COVENT GARDEN, March 16.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

THE supply of Grapes becoming shorter, and values enhanced; samples not keeping well. Trade still quiet. *James Webber, Wholesale Apple Market.*

POTATOS.

Trade remains very quiet, although stocks on hand are being lowered.

NEW POTATOS.—Arrivals this week very light, and best samples commanding higher prices. *J. B. Thomas.*

SEEDS.

LONDON: *March* 15.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, that as might be expected, there is now a good sowing demand for farm seeds. Cow-grass and Red Clover seed keep steady. White Clover seed has become scarce and is dearer. There is no change this week in either Alsyke or Trefoil. Rye-grasses are firm. For spring Tares there is an active request. Brunswick Gore Vetches are obtainable on moderate terms. Canary seed is dull just now. Some arrivals of Hempseed, released from the ice, are shortly expected. For Haricot Beans there is a better sale. Blue Peas are still neglected. Mustard and Rapeseed keep steady.

FRUITS AND VEGETABLES.

SPITALFIELDS: *March* 14.—Quotations:—Sprouting Broccoli, 1*s.* 6*d.* to 2*s.* 6*d.*; Turnip-tops, 1*s.* 6*d.* to 2*s.*; Swede-tops, 1*s.* 6*d.* per sack; Sprouts, 1*s.* to 1*s.* 3*d.* per half-sieve; Curly Kale, 1*s.* 6*d.* per bushel; Cauliflowers, 4*s.* to 7*s.* 6*d.*; Savoys, 2*s* to 3*s.* 6*d.* per tally; Greens, 1*s.* to 1*s.* 6*d.*; Turnips, 2*s.* to 2*s.* 6*d.*; Carrots, 2*s.* to 3*s.* per dozen bunches; forced Rhubarb, 1*s.* 3*d.* to 1*s.* 6*d.* per dozen bundles; Horseradish, 2*s.* to 2*s.* 6*d.*; Celery, 1*s.* 3*d.* to 1*s.* 6*d.* per bundle; English Onions, 9*s.* to 10*s.* per cwt.; Spanish do., 9*s* to 10*s.* per case; Mustard and Cress, 2*s.* per dozen baskets; fruit unaltered in value.

BOROUGH: *March* 14.—Quotations:—Savoys, 3*s.* to 6*s.* per tally; Sprouts, 1*s.* 3*d.* to 1*s.* 6*d.* per half-sieve; Turnip-tops, 1*s.* 6*d.* to 3*s.*; Broccoli, 1*s.* 9*d.* to 2*s.* 6*d.* per bag; Greens, 1*s.* 6*d.*; Parsley, 3*s.*; Carrots, 2*s.* 6*d.* to 3*s.* 6*d.*; Turnips, 1*s.* 6*d.* per dozen bunches; English Onions, 10*s.* to 12*s.* per cwt.; Dutch do., 6*s.* per bag; Horseradish, 2*s.* 3*d.* to 2*s.* 6*d.* per bundle; Apples, 4*s.* 6*d.* to 8*s.* per bushel.

HOLLOWAY'S PILLS.—Good digestion.—Holloway's Pills are universally acknowledged to be the safest, speediest, and best corrective for indigestion; loss of appetite, acidity, flatulency, and nausea are a few of the inconveniences which are remedied with ease by these purifying Pills. They strike at the root of all abdominal ailments, they excite in the stomach a proper secretion of gastric juice, and regulate the action of the liver, promoting in that organ a copious supply of pure, wholesome bile, so necessary for digestion. These Pills remove all obstruction and obstruction, and from their harmless composition are peculiarly well adapted for delicate persons and young children; whilst casting out impurities these excellent Pills strengthen the system and give muscular tone.

GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH"

ROLLING AND COLLECTING MACHINES FOR 1893.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in **constant** *use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.*

Patronised by— They are the first, foremost, and best in the world.

HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS.
The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The *"Journal of Horticulture," of June 9, says:—* "MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 195,000 of these Machines have been Sold since they were first introduced in the year 1856,
And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.
They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER,
With Improved Steel Chains and Handles.

The Vineyard and Nurseries

GARSTON, near LIVERPOOL.

WANTED, a NURSERY, Going or Closed.
Must have several Glasshouses.
H. T. G., Hawthorne Lodge, Sunbury-on-Thames.

To Capitalists and Others.

TO BE SOLD, the BUSINESS of a NURSERYMAN, SEEDSMAN, FLORIST, and LANDSCAPE GARDENER, situated in one of the best parts of London, and 7 miles from Covent Garden, doing a highly lucrative, large, and increasing business, and having an immense and valuable Stock. This would suit two or more persons, and offers an opportunity rarely met with of acquiring a thoroughly genuine concern. Every investigation can be made.

Apply, in first instance, to HORTUS, 41, Wellington Street, Strand, W.C.

NURSERY for SALE, or to be LET, near Blackheath, S.E., in working order. Land 442 feet by 150 feet (more or less), at low ground rent. Contains seven Glass Houses, about 100 feet to 123 feet long, heated by three Boilers; three Cold Frames, about 100 feet long; Planting Ground, &c. Stock at valuations, if desired.—Apply to THOMAS PEACOCK, Warwick Square, London, E.C.

To Lovers of Forestry and Gardening.

THE LEASE of a charmingly-placed HIGH CLASS RESIDENCE, in 40 acres of luxuriantly-timbered Grounds, for SALE, eight or nine miles from the City and West-End. A Gentleman's Residence in every respect. Price £1000 for 70 years' Lease, at £300 per annum ground-rent.

Apply to Messrs. HARMAN BROS., Auctioneers, 75, Aldermanbury, E.C.

A First-class, Old Established

FLORIST and SEED BUSINESS, within 8 miles of Covent Garden, comprising large Shop in a main thoroughfare, and Two Nurseries near by. Long lease. To be DISPOSED OF IMMEDIATELY, in the whole or separate, at a very low figure. Good opportunity for an experienced man.—Address, G. R. C., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

LONDON, S.E.—Good residential district. Capital JOBBING BUSINESS, ½ Acre, with 6 Greenhouses. Lucrative local Business. Turnover £500. Lease fourteen years to run. Rent £10. Price £300, open to offer. Apply, PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C.

Under Deed of Assignment.

THE VALUABLE NURSERY, LANDSCAPE, JOBBING, DECORATING, and CUT FLOWER BUSINESS, of Daniel Robinson, Withington Road, Whalley Range, Manchester, MUST BE DISPOSED OF AT ONCE, owing to the long-continued ill-health of the proprietor, and is now offered as a GOING CONCERN, WITHOUT RESERVE. The Jobbing connection alone is a good business in itself. The Nursery contains 4620 square yards, or thereabouts, at a rental of £60 10*s.* on chief for 999 years, and a road-rent of £2 10*s.* per annum, improved and improving in value, and contains a collection of good-class Specimen Hollies, Rhododendrons, &c., suited to the business; 5 Large Houses, with excellent assortment of well-grown high-class Orchids; fine pans of Cœlogyne, nearly all Chatsworth and maximum varieties; Cattleyas, Dendrobes, &c., with a well-assorted collection of Ornamental, Stove, Greenhouse, Bedding and Herbaceous Plants; excellent Sheds for Asphalting and Jobbing-work, Cold Frames, Office, &c. Everything is in good condition, and built on the best principle for the requirements of the business, with room on an excellent site for additional houses, and would be a valuable investment for an energetic man or Firm.

For further particulars and to treat, apply to Mr. CHRISTOPHER PRESTON, Solicitor, 32, St. Ann Street, Manchester; or to the Trustee, Mr. PERCY E. LAND, Chartered Accountant, 64, Cross Street, Manchester.

Priory Nursery, Acton Lane, Middlesex.

TO BE LET, part of remaining Grounds, in portions, or as a whole (nearly 3 acres), having about Eighteen large Greenhouses, in good working order, near to four Railway Stations, and London Markets. An uncommon opportunity to Tomato and Cucumber Growers, &c.

Apply, on the Premises, or of Mr. HORSNAIL, 96, Newgate Street, City, London.

TO LET, Immediately, through ill health, a genuine SEED, PLANT, and FLORISTS' BUSINESS, in growing Market Town, near London, main thoroughfare. Thorough investigation. Good opportunity for pushing man.—H. A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

FOR SALE, Cheap, a good ROCHFORT and other BOILERS, quantity of 4-inch and 3-inch Elbows, Syphons, Valves, &c.; 2006 feet of 3-inch pipes. Apply to—J. LANCASTER, Barnett Cottage, Esther Road, Leytonstone.

LOBELIA, Emperor William, good bushy stuff, 2*s.* 6*d.* per 100. CALCEOLARIA, Golden Gem, 5*s.* per 100.—S. HARBER, Tettenhall, Wolverhampton.

Tea Roses in Pots.

H. B. MAY offers extra strong plants, in 6 and 8-inch pots, best sorts for indoor culture. Prices and sorts on application.

Dycon's Lane Nurseries, Upper Edmonton.

CŒLOGYNE CRISTATA, from 6*d.* each; larger, with bloom spikes—a few fine specimens of the Trentham variety.

TRUSTEES of the late J. STEVENSON, Timperley, Cheshire.

To the Trade.

SCOTCH FIR (True Native), extra fine, well-rooted plants in quantity, 15 to 20, 18 to 24, 24 to 30, and 24 to 36 inches; Native LARCH, 2 to 3, and 3 to 4 feet; strong ASH, OAK, BEECH, SYCAMORE, BIRCH, POPLAR, and Whinham's Industry GOOSEBERRY. See LIST, Free.

THOMAS MATHESON, Nurseries, Morpeth.

SEEDLING PALMS, Kentias and Areca Baueri, from Stores, 2 to 3 leaves, 15*s.* per 100; or Exchange for Stock, Stove or Greenhouse Plants.

DICKSONS NURSERIES, CHESTER.

SHEPPERSON'S NOVELTIES and SPECIALTIES (THIRTY-FOURTH YEAR OF ADVERTISING).

The following Novelties and Specialties, having all been grown in a very exposed situation high up on the Derbyshire hills, are very hardy, stocky, and healthy, very diffe ent to weak seedlings grown in warm favoured situations which look nice, but very rarely succeed well. All carriage free for cash with order. Descriptive List free.

CHRYSANTHEMUMS (Special Culture).—Not a collection of old-fashioned sorts, but the cream only of the best English, French, American, and Japanese raisers, including the very latest novelties; good well-rooted plants, 12 for 2s.; 25 for 3s. 6d., warranted true to name; 12 selected extra varieties, all new, of 1891 and 1892, for 4s.

PANSIES (a great specialty).—Five Silver Cups and other prizes, the cream only of the most noted raisers, the latest new sorts and the winners at all the great shows; good plants, correctly named, show or fancy, 12 for 3s.; 25 for 5s. 6d.; 50 for 10s. 6d.; 100 varieties, 20s.; also seed, 1s. and 2s. 6d. per packet.

DORONICUMS (Golden Stars or Hardy Marguerites).—Three distinct first-class sorts—Harpur Crewe, Clusi, and Plantagineum excelsum, 1 each for 1s. 6d.; 2 for 2s. 6d.

CARNATIONS, PICOTEES, and CLOVES of the finest named hardy border varieties; many grand new sorts; strong layers, wintered outside, 6 for 2s. 6d.; 12 for 4s.; 25, in twelve varieties, for 7s. 6d.; also seed from above splendid collection, 1s. and 2s. 6d. per packet.

PHLOXES (Perennials).—Special culture of early and late varieties; the cream only from Downie, Laird & Sons, Kelway, Ware, and other first-class growers; 6 fine varieties, 2s.; 12 for 3s., true to name; strong stools to bloom we l.

GEUMS.—The new double Scarlet, a splendid hardy free-blooming plant, and fine for cutting; strong two-year-old plants, 12 for 1s. 6d.; 25 for 2s. 6d.; 100, 9s.

CANTERBURY BELLS.—Grand new colours and new forms, double and single Telescopes, Hose-in-Hose, Cup and Saucer, and other varieties; 12 plants to bloom well, 1s. 6d.; 25 for 2s. 6d.; 100, 9s.; also seed, 6d. and 1s. per packet.

VIOLAS, during the last few years, have come to the front as few flowers have ever done; they are wanted everywhere, and very few plants produce so fine a display for so little trouble. I have a grand collection, including many new varieties; 12 varieties, named, 2s.; 25 for 3s. 6d.; 100, 12s.; seed, 1s. per packet.

12 Pure Snow-white Garden PINKS, sweetly scented, 1s. 6d.; 25 for 2s. 6d.; 100, 9s.

NEW WHITE BORDER PINK, Her Majesty (Ware).—Flowers very full, very large, and remarkably strong; constitution pure white and fragrant; has received a large number of first-class certificates; a really grand new variety; 2 for 1s. 6d; 3 for 2s.; 6 for 3s. 6d.

12 Beautifully Spotted or Pure White FOXGLOVES for 1s. 6d.; 25 for 2s. 6d.; 100, 9s.

NEW HARDY JAPANESE PRIMULAS (Hybrids of Primula Sieboldi).—This new class of hardy Primula, which has become so popular either for the outside border or the greenhouse; since its introduction it has been greatly improved, the new varieties being really grand. The following collection is the production of Mr. Geggie, the celebrated raiser, whose collection has gained first prizes, gold medals, and first-class certificates at the Crystal Palace, Royal Horticultural, Royal Botanic, and other important societies; 6 distinct varieties, named, 3s.; 12 for 5s.

AURICULA (Alpines).—A splendid collection, the result of many years' careful selection; strong plants, to bloom well, very different to untried seedlings, 12 for 3s.; 25 for 5s. 6d.; seed, 1s. per packet.

ASTERS (MICHAELMAS DAISIES).—Unrivalled hardy autumn-flowering border plants, and for cut flowers; a grand collection of the latest improved colours, as pure white, pink, bright mauve, &c.; 6 distinct sorts for 1s. 6d.; 12 for 2s. 6d.; 25, in twelve varieties, 4s. 6d.

CARNATIONS, PICOTEES, and CLOVES.—Strong year-old plants, seedlings from the finest named varieties, will produce 80 per cent. of fine double flowers of the very best colours only, such as white, pink, scarlet, crimson, purple, yellow, striped, spotted, &c.; 12 varieties, 2s. 6d.; 6 for 1s. 6d.; 100, 15s.

MALVA MOSCHATA.—Pink and white, hardy border plants, grand for cutting, 1s. 6d. per dozen; 25 for 2s. 6d.; 100, 9s.

POPPIES have now made their way to the front, and none are so popular as the hardy perennial varieties Nudicaule and Orientalis, free and continuous flowering, and bright striking colours; 6 for 1s. 6d.; 12 for 2s. 6d.; 25 for 4s.

GAILLARDIAS (Perennial hybrids).—A really grand collection of these most gorgeously-marked hardy plants, colours scarlet, crimson, and gold of different shades; blooms all the summer; 6 for 1s. 6d.; 12 for 2s. 6d.; 25 for 4s.

PYRETHRUMS (Double and Single).—A grand collection to name, selected from the best English and French raisers; as a hardy, free-flowering, easily-grown plant for all purposes, the Pyrethrums are among the very best; 3 named varieties, 1s. 6d.; 6 for 2s. 6d.; 12 for 4s.

CARNATION MARGUERITE.—This grand novelty has proved itself to be the most remarkable of all the Carnation family; it commences blooming early in summer, and goes on till late autumn; it will produce quite 80 per cent. of fine double flowers of the most beautiful colours and markings; 12 for 2s.; 25 for 3s. 6d.

AURICULA (Alpina), the real old Irish Dusty Miller.—A most beautiful hardy, easily-grown, sweetly-scented, free-flowering variety; 6 strong plants, 2s.; 12 for 3s.; 100, 20s.

IRIS GERMANICA.—Rivals of the famed Orchid flowers, of peculiar formation, and most exquisitely marked with many bright and distinct colours; quite hardy; 3 named varieties for 1s. 6d.; 6 for 2s. 6d.; 12 for 4s.

POLYANTHUS & PRIMROSE HYBRIDS.—Splendid mixed colours; finest strain grown; 12 for 1s. 6d.; 25 for 2s. 6d.; 100 for 9s.; all good hardy blooming plants; also seed, 6d. and 1s. per packet.

DELPHINIUMS.—A splendid lot raised from twelve new varieties of Kelway's double and single, including Lord R. Churchill, Melton, James Kelway, and others; good plants, to bloom well, 6 for 2s.; 12 for 3s.; 50 for 10s.; also seed, 6d. and 1s. per packet.

PRIMULA CASHMERIANA.—A really fine spring-flowering plant, colour bright mauvy-violet; free bloomer; should be in every garden; 3 for 1s. 6d.; 6 for 2s. 6d.; worth double.

CAMPANULA PERSICIFOLIA.—Single white, double white, double blue, and grandiflora. All quite hardy and unrivalled for border decoration, cut flowers, wreaths, &c.; 1 of each for 1s. 6d; 2 of each for 2s. 6d.

ARABIS ALBIDA VARIEGATA.—A splendid variegated variety for the rockery or front rows, to beds and borders; flowers pure white; 6 for 1s. 6d.; 12 for 2s. 6d.

12 HARDY PERENNIAL BORDER PLANTS (named), distinct and useful for decoration and cutting purposes, 2s.

12 DISTINCT PLANTS for Windows, 2s.

GERMAN SCABIOUS.—Eight distinct colours of this most beautiful, hardy, free-flowering, easily-grown attractive plant; really grand for border decoration and cut flowers; 12 for 1s. 6d.; 25 for 2s. 6d.

HOLLYHOCKS.—Warranted all fine double flowers, Chater's select strain; strong year-old plants to bloom this summer; 12 varieties, 3s.; 6 varieties, 2s.

SPECIAL OFFER of 100 strong healthy plants of fancy and show PANSIES and VIOLAS for an early and extra show for the borders, unnamed, 10s.; or 50 for 5s. 6d.

STRAWBERRY PLANTS.—A grand collection, including many grand new varieties from the best English, French, and American raisers, 3s. per 100.

The Patent Silicate Manure for Early Potatos.

The striking effects our Silicate has produced on Tomatos are seen on POTATOS as regards their EARLY MATURITY.

Fordingbridge, Hants, *September* 2, 1892.

DEAR SIR,—I can speak of your Silicate in terms of unqualified praise. I tried it especially on two beds or plots of Myatt's Ashleaf Kidney Potatos, side by side with two beds not so treated, with the result of more than **25 per cent. increase in measure,** and although not one of the earliest varieties of Potatos, was able to dig good sized tubers **eight weeks after planting.** Some roots yielded as many as twenty-six tubers fit for table, scarcely any falling under twenty.

(Signed) G. PARBERY.

Prices in Sacks at Works:—10s. per Cwt.; £2 per ¼ Ton; £3 15s. per ½ Ton; £7 per Ton.

FIXED.

THE IMPROVED GARDEN GULLY

(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1*s.* 6*d.*; 8-in., 2*s.*; 10-in., 3*s.*; 12-in., 6*s.* 6*d.* 15-in., 8*s.*

(*The larger sizes are very strong for carriage drives.*)

Gardeners' Chronicle.

SATURDAY, MARCH 25, 1893.

MARKET GARDENING UNDER GLASS.

WHEN the deputation of fruit salesmen and others waited upon the President of the Board of Trade in respect of the revised railway rates, as reported in our columns, p. 269, the members were able to cite figures dealing with the amount of fruit and flowers produced under glass in this country. We were, of course, prepared to hear that there had been a very great increase in the supply of late years; nevertheless, the figures given were astounding. This circumstance has led us to make a visit to some of the principal growers in the vicinity of London, to inspect the establishments where a large proportion of the immense quantities of choice fruits and flowers are produced. Everywhere we met with a courteous reception, and the reason was not far to seek, for the general character of the gardens which we were able to inspect was decidedly satisfactory, and the proprietors in such cases have nothing to fear in showing their plants to the visitor. Anyone may have noticed, and none more so than gardeners, that the plants and the fruits which are sent to Covent Garden and elsewhere are for the most part of really good quality, and many wonder that market growers are able to supply such products, and to sell them at a profit at such prices as generally obtain. There can be little doubt but that this can be best explained after a visit to the establishments, and a conversation with the growers. In the first place, we noticed that in most places—especially those of medium size—only a very limited variety of plants or fruits is grown, and are chiefly those of which the particular proprietor was naturally most fond prior to his taking up the business. Thus in one place we found Gardenias, Carnations, and Roses, to the exclusion of almost everything else, and consequently the entire force and skill available are concentrated upon the requirements of three genera, and perhaps in each genus only two varieties are permitted. Gardeners who have to contend against the necessary evil of cultivating a variety of plants in the same house will easily appreciate the economy of labour, &c., in such a system. Then, again, the plants and houses are kept, in many instances, entirely free from such pests as mealy-bug, scale, &c., so that no time is expended "keeping under" these insects. It must also be remarked, that the majority of the market growers are hard-working men, and throw the whole of their energy into the business. Another point we learned, and that touching the new railway rates, was that most growers within a radius of 20 miles from St. Paul's, send their products to the London markets in their own vans, and are

*

affected only by the "revision" in sending to other markets, such as Newcastle, Manchester, and Liverpool. In these cases it has made much difference, and yet more in the fuel and other necessaries for carrying on the establishment. In some cases the rates have been re-adjusted, and are now as low as they were before the revision, but with this difference, that whereas they were then carried at the Company's risk, they are now accepted only at the risk of owner. Whether there will actually be more accidents occur owing to this change of responsibility, remains to be seen.

Before noticing a few of the places at which our information was gleaned, perhaps it may be instructive to some if we state, that although this kind of market gardening is undoubtedly profitable to the small capitalist with thorough practical experience and plenty of energy, it is also quite plain that competition is keen enough to prevent persons who have not these qualifications from meeting with any degree of success. In a limited area, within 14 miles from Charing Cross, we were told of thirty who started this business on a small scale during the last three years. Some have already failed, and others have succeeded, and many are fast succeeding in establishing a good, profitable, and interesting business.

Mr. W. Milne.

On a pleasant spot upon Hampton Hill we found Mr. Milne, who devotes his time almost exclusively to the growth of Carnations, Roses, and Gardenias. The ground which he bought some twelve years ago is about 4 acres in area, but it is only a small portion that is yet covered with glass. No private garden could be kept better than are the plants at this establishment; and notwithstanding the wonderful stock of Gardenias, it is believed that a mealy-bug does not exist upon the place. Of Carnations, old and young, there are about 20,000, and in the season (which will now soon commence) an average of 200 dozen blooms are sent to market at one time, reaching in some cases to 300 dozen in a single day. Madame Carle, Alegatière, Miss Joliffe, and two others are the only varieties grown.

Gardenias are cultivated both in pots and planted out, the better and larger collection being in the three borders of a span-roofed house about 180 feet long. A wide bed in the centre and two rather narrower ones at each side, with a path on either side of centre bed. Some of them are about 5 feet high, and as many feet through, and are in the very best of health, perfectly clean, and set with myriads of buds almost ready to burst. These continue to bloom from April until October, with a slight break about midway, when they receive all the pruning they get during the year. In the mid-season as many as 300 dozen have been sent away in a day; and this is not considered exceptional. The seedlings were planted in ordinary soil from the field upon which the houses stand, and have been several times top-dressed with old soil from Carnation pots, to which is added a little fertilising manure. Those in pots are accommodated in another house, but from the glance we were able to take, the planting-out system is at once the cheapest and the most successful method.

Roses are forced in three or four of the large houses containing some thousands of plants. They are seven or eight years old, and produce about half-a-dozen blooms on each, are kept dwarf, and receive a little liquid manure during their flowering season. Although blooms are ready for cutting before Christmas, not a trace of mildew has disfigured the foliage. General Jacqueminot, Baroness Rothschild, and a few Teas, are the only varieties.

Chrysanthemums are planted out in the field, and upon the appearance of frost are lifted and planted again in the house—about 5000 are thus grown. In the houses devoted to the later batches of Roses, a crop of Cucumbers is secured as soon as the Roses are turned outside for the summer, and in these houses the Chrysanthemums are also planted, the later Roses not requiring protection until Christmas time.

Mr. Milne has also given much attention to boilers, and from his plans have been brought out several by the Thames Bank Iron Co., the latest, which appears to us of considerable merit, being not yet upon the market. Mr. Milne's is a thoroughly well-kept establishment.

Mr. George May.

Not far from the place just noticed is that of Mr. Geo. May at Upper Teddington. Large in extent, having about 6 or 7 acres covered by glass, more than half of this has been erected during the last five years. It is noteworthy more especially from the almost unequalled stock of Eucharis plants possessed. These are cultivated in seven or eight large span-roofed houses, which are filled to overflowing with the most vigorous and healthy plants it would be possible to see. Mr. May himself could give no idea of the number of plants that are here, but they exist in thousands, and the idea is, we believe, to get a few more houses full, until there are as many as there are months in the year. In the whole stock there is supposed to be no bug, and consequently there is no time spent upon sponging, for the foliage is kept clean with the hose. This place is, no doubt, responsible for a very large proportion of the Eucharis blooms that are seen at Covent Garden, and some others. Mr. May seems not to dread the mite in the least, and thinks they cannot successfully attack bulbs so healthy and robust. The plants are accorded ordinary treatment, and are potted every third or fourth year. They are always kept growing, and a constant supply rather than quantities at certain periods is the aim.

Another great feature is the Roses. Large house after house are devoted to them, and as at the last place, Baroness Rothschild and General Jacqueminot figure largely. But here we find a greater quantity of Teas, including Niphetos, Belle de Jardin, Catherine Mermet, &c. In the earliest house, and there only, did we see any sign of mildew, and amongst these was being distributed flowers-of-sulphur, which the grower, Mr. Forsyth, relies upon to move every trace without any injury whatever to the foliage.

Carnations are grown in perhaps greater quantity than are the Roses, and the output from these when in season must be enormous. The greater part of the stock consists of a variety known as Uriah Pike and Miss Joliffe. The former is a very lovely crimson self, and clove scented, but is said to be of very good constitution, and will produce a dozen blooms where Old Clove would only produce one. The entire stock of these looked well, and are producing a good show of buds; but the Malmaison group have dwindled from a healthy lot, possessed last year, to a miserable few, that are fast succumbing to the attack of the Carnation fungus, which has been figured so often in our columns. The only thing which appears to be practicable when they are badly infested is to throw them away, and commence again. The fleshy-leaved varieties are peculiarly liable to attack, and the Malmaisons, perhaps, most of all.

A very considerable stock of Ferns is kept for cutting purposes; and among some Tuberoses which were in bloom, Mr. May pointed out many which were from tubers that did not flower last year, and for that reason had been kept until this.

Cyclamens at Hanwell.

For several years past Cyclamens have been a *specialité* at the establishment of the St. George's Nursery Co., and a few days since, when we had the pleasure of a visit there, the stock plants were in full bloom. Large and thick flowers in beautiful colours, numerously produced from each corm, at once convince you of the excellence of the strain, and the greater part of the plants kept for seed purposes have gained awards for their distinct merits. The objection might easily be raised that there can be no need for naming particular varieties of Cyclamen, but for the purposes of propagation the growers find that it is essential, and when an extra good form or colour is obtained, a name is given, and the seed from that plant will produce many of the characteristics—sometimes all—of the parent. It is these stock plants, all acknowledged good varieties, that are now blooming at Hanwell, and they are well worth a visit from any desirous of seeing a fine strain. We were informed that they would be exhibited at the Crystal Palace on Saturday. Taking the whites first, Dame Blanche is a very decorative flower, not quite perfect in the florist's eye, but having a curiously-twisted appearance about the petals; these are very broad, and not long. Mont Blanc has longer petals, and is a less compact-looking flower. A smaller but more perfect bloom is Baroness Burdett Coutts, and gains much favour. The Duke of Fife is a dark rose flower, with purple base. Excelsior is a very pretty one, being of pure white, excepting the base, which is coloured. Picturatum has a purple base, with the upper part of tinted white. Sunray is one of the tinted Persicums; the flower is rose, with very dark purple base—this bloom is much lighter in colour when first opening, and there are consequently many differently-coloured blossoms upon the plant at one time. Brilliant is the darkest of all, is a small compact bloom, and of very exceptional merit. Princess May is a chaste flesh colour with rose base, and Prince of Wales a dark purple. There are several seedlings also, which will rank among the first of these mentioned. About 20,000 seedlings will be raised, and most of them are for market trade, but a little business with the trade is done with seeds. One very large new house contains a magnificent stock of Asparagus tenuissimus and A. plumosus, all kept for cutting purposes, as are also a batch of Eulalias. Calla æthiopica is here to the extent of 5000.

(To be continued.)

New or Noteworthy Plants.

Galanthus maximus, *Baker, n. sp., or hybrid?**

This new Snowdrop is remarkable for its very robust habit, large leaves, spathe and flower, and long pedicel. The leaves have a distinctly recurved edge, as in G. plicatus, and are very glaucous beneath. The flowers resemble those of the large forms of G. nivalis. The anthers are distinctly mucronate, and there is only present an apical green blotch on the back of the inner segments of the perianth, but this extends nearly half-way down. I have received a good supply of the plant in a living state from Mrs. Backhouse, of Sutton Court, near Hereford. It flowers in the first fortnight in March, and the bulbs are so large that Mrs. Backhouse tells me they have been planted in mistake for those of a Narcissus. If not a true species, it is, no doubt, as Mrs. Backhouse suggests, a hybrid between G. plicatus and one of the large varieties of nivalis, such as Imperati, Melvillei or Redontei.

Bulb globose, fully an inch in diameter; sheath 4 inches long, oblique or truncate at the throat. Leaves reaching a length of 8 to 9 inches above the sheath at the flowering time, ½ to ¾ inch broad, slightly glaucous above, very glaucous below, with a concave tip and distinctly recurved edges. Peduncle as long as the leaves or a little longer, in all above a foot. Spathe 2 inches long, linear, with very revolute edges. Pedicel rather shorter than the spathe. Ovary ¼ to ⅓ inch long. Outer segments of the perianth oblong-spatulate, an inch long, ⅓ to ½ inch broad, convex on the back. Inner segments obovate-

* *Galanthus maximus*, Baker, n. sp., or hybrid?—Bulbo globoso maximo; foliis magnis dorso glaucescentibus margine recurvatis; scapo elato foliis æquilongo; spathâ bi-pollicari; perianthii segmentis exterioribus oblongo-spathulatis pollicaribus dorso convexis, interioribus exterioribus duplo brevioribus obovato-cuneatis emarginatis lobis orbicularibus planis macula viridi dorsali unica magna; antheris apiculatis.

cuneate, ⅛ inch long, with round uncrisped erect apical lobes, and a large blotch of green round the sinus. Anthers apiculate, ¼ inch long. *J. G. Baker.*

Dendrobium × Benita (D. aureum ♀, D. Falconeri ♂). *New gard. hyb.*

This beautiful novelty, raised in the gardens of W. E. Brymer, Esq., M.P., Ilsington, Puddletown, Dorchester, while bearing in its flowers some resemblance to those of D. Ainsworthii, yet gives sufficient indication of the influence of D. Falconeri, and (heterocarpum), although the pseudobulbs are more thickened at the nodes than are those of that species or D. nobile. There is one very distinct plant in the batch, having a more branching habit, and thinner linear leaves."

It is a very handsome Dendrobium, and it bears the name D. × Benita at Mr. Brymer's request, in complement to his niece. *J. O'Brien.*

Odontoglossum blandum var albo-cupreum, *new var.*

Under the provisional name O. albo-cupreum,

Fig. 50.—Senecio sagittifolius: flowers creamy-white; centre, dull yellow

especially in the longer and more acuminate form of the labellum. The flowers, which are borne in pairs, are 3½ inches across; the sepals white, tinged with pale lilac hue on both surfaces; the petals white, tinged with amethystine purple on the outer halves. The labellum is white, with radiating lines of purple at the base, which expand into a rich purplish blotch, which fills the larger proportion of the area of the lip. The purple blotch has a pale primrose band in front, and the tip of the labellum is coloured like the tips of the petals. Of the growth of the plants, Mr. John Powell, the gardener at Ilsington, gives the following particulars:—"The plants vary in their habit of growth. The two which have flowered partake most of D. aureum Mr. Chas. Vuylsteke, the noted Odontoglossum grower, of Loochristi, Ghent, exhibited at the Royal Horticultural Society, on March 14, a strange and beautiful little Odontoglossum, which anyone might be excused for considering a distinct species. Since that I have had the inflorescence forwarded to me, and after having compared it with several forms of O. blandum, I find that there is little beyond colour-difference to separate it from that species, even although that is sufficient to cause it to be regarded as an extraordinary variation.

The segments of O. blandum are usually white, or nearly white, spotted with red or brown, those of the variety albo-cupreum are pale primrose barred and banded (not spotted), with copper-coloured markings except the tips, which are pale primrose. The labellum instead of exhibiting the violet markings seen in more or less quantity in the type, is entirely pure white, except at the base, which is yellow as in typical O. blandum. It is a very pretty variety. *James O'Brien.*

Senecio sagittifolius, *Baker.**

We owe to our friends of the *Revue Horticole* the opportunity of figuring this fine perennial, originally described by Mr. Baker, but introduced into cultivation by M. Ed. André, who met with it in Uruguay. It is now in bloom in No. 5 house at Kew, where it bears out all that has been said of its interest and attractiveness. It is a stately perennial, with bold tufted and lobed leaves covered with white down. From the centre of the tuft uprises a tall flower-stem (in the Kew plant about 3 feet high) bearing scattered sessile, lanceolate leaves at intervals, and terminating in a loose corymb of creamy-white Aster-like flower-heads, each about an inch across. The lower leaves have a broadly-winged stalk, and a lanceolate blade, deeply sagittate at the base and sometimes lobed at the margin also, whilst from the midrib on the upper surface springs a curious wavy, leafy crest, consisting of two plates an inch or two in depth, and extending from the base more than half-way to the apex of the leaf.

M. André narrates how he was riding in Uruguay over a turfy prairie, when his attention was directed to a number of small mounds like molehills, on which these noble plants were growing by hundreds, with scarcely any other plant, so that a distinct aspect was given to the landscape (see fig. 51). M. André gives a full description of the plant in the *Revue Horticole*, which need not be repeated here; but we may add that the plant is offered for sale by M. Bruant, of Poitiers, in whose establishment the lower leaves attained a length of about a yard whilst the flower-stalk rose to a height of 6 to 7 feet, with 140 flowers. In the south it migh, possibly prove hardy, but it would be safer for the present to treat it as a conservatory plant. It would make a magnificent subtropical plant.

A coloured figure is in preparation for the *Botanical Magazine*. *M. T. M.*

Œceoclades maculata.

I see with pleasure that Mr. Rolfe is continuing his useful list of garden Orchids, and has reached Eulophia, a very unpopular genus with gardeners. In such a list as this, one does not look for critical study and revision of genera, but still one is glad to see old errors eliminated, and heterogeneous genera broken up in any list. In dealing with Eulophia he has kept distinct Lissochilus and Cyrtopera. That the former of these passes into Eulophia, all who know the two genera will admit; but taking the broadened petals as a distinguishing mark, I would agree that for convenience sake Lissochilus may be kept apart as a distinct genus. Cyrtopera is, however, a much weaker genus; the prolonged column-foot varies so much, that one can attribute but little value to it. Still, it makes a good section. But why is Œceoclades maculata, Lindl., still retained in this genus? Dr. Pfitzer long ago showed that it had relations rather with the Maxillarias than with Eulophia; and of the other critical students of Orchids who have written of it, Lindley, Link and Otto, Sprengel, Achille, Richard, Prillieux, and Rivière; none but Reichenbach have thought of referring it to Eulophia, though Bentham, from "specimina manca," thought he was probably right in so referring it. Spencer le M. Moore follows Reichenbach too (*Flora of Mauritius*), but gives no reasons.

Certainly, to look at it growing wild, one would not think of its being an Eulophia at all. Its stiff leathery leaf at once repels the suggestion; and when one adds to this the distinctive vegetative characters

* *Senecio sagittifolius*, Baker, in *Flor. Brasiliens*, vi., part iii., 1882—1884; André, in *Revue Horticole*, 1892, p.53.

pointed out by Pfitzer, the form of the pollinia, and the fact that no other Eulophia is known from the New World, one wonders why it found its way into this genus at all. In a paper on its cleistogamy (*Journ. Linn. Soc.*, xxiv., 389), I used Lindley's old name Œceoclades for the genus. This genus as described was very heterogeneous. It included species of Sarcochilus, Saccolabium, Angræcum, Dendrophylax, and Cleisostoma, all of which have now been referred to their right places, and Œceoclades as a genus has disappeared, unless we keep the sole remaining species as a type of it. Should the lovers of the study of nomenclature, however, object that it has nothing in common with the other supposed species, and that Lindley himself was doubtful as to its position, there is still Pfitzer's Eulophidium, to which there can be no objection.

In any case let us not continue to call it an Eulophia, to which genus it certainly does not belong. To the neighbourhood of this plant Mr. Rolfe refers Eulophia Ledienii, Stein, E. monophylla, Moore, and E. Mackenii, Rolfe. Of the first, I have only seen N. E. Brown's descriptions in the *Kew Bulletin*. Mr. Brown says he considers it distinct from the Brazilian species, but his condensed description would very well fit the latter, and he gives no distinguishing character of any value. I suppose a plant in Welwitsch's collection in the British Museum belongs to this species. I could not distinguish it from the specimens and notes from the Brazilian one.

E. monophylla, Moore, appears to be distinguished by its "few-flowered corymbose raceme." I see no other difference of any value in the description. The compactness of the raceme, however, probably depends on the strength and age of the plant, and can hardly, unless it is very much more marked than in Richard's figure, be even of varietal value.

E. Mackenii, Rolfe, from the short diagnosis given in the *Gardeners' Chronicle*, I gather, differs in the form of the leaf, broader lobes of lip, and the median lobe being sessile and with no claw. This looks like a dryer country variety. The dimensions of the claw of the mid-lobe in widely distributed plants which possess it, e.g., Calanthe veratrifolia, vary so much, that one cannot safely use it alone as a distinctive character.

I have omitted characters drawn from the colour-tints of the leaf. They are absolutely worthless in tropical vegetation. Leaves of jungle plants vary much in colour and markings. Here exposure to hot sun gives very often a brilliant pink or red colouring, which will keep true for often a long time; but after a few months in damp-shade will disappear. There is here a Dendrobium (§ aporum), D. serra, of which the leaves grown for a long time in the sun, become bright red, and the fruit even, but not the flowers. Take it into the shade, and eventually the red colour goes, and the plant becomes of the ordinary dull dark green. We use a quantity of Alternanthera versicolor and Iresine Herbstii here for bedding, and the difference in the appearance of the gardens after a few dull days, from the otherwise brilliant red leaves being replaced by shabby-looking purplish-green, is very striking. Further, there are striking variations in colour in jungle leaves for no apparent reason. I have just been collecting in the Mountains of Johore a very pretty species of Rhynchopyle, which I hope to send, with several other pretty novelties, to England in the spring. It was very abundant in rocky streams in the hills. The leaves are either plain dark green, or more or less mottled with light green spots, like some kind of Dieffenbachia. All the forms grew mixed up together, and there was no reason at all visible why some should be thickly spotted and others quite plain. The seedlings had their leaves plain or spotted, according to what adult leaves they were going to develop. When the first spotted-leaved forms were brought me, I did not recognise the plant at all as the plain green-leaved thing I knew so well in Perak and Pahang; specifically, however, it is identical.

This is rather a digression from Œceoclades, but I should like to impress upon some of our describers of "New Garden Plants" the fact that making new species from leaf-colouring, and even from leaf-form only, in many instances is merely adding to synonomy. No two plants have been worse treated in this respect than Hæmaria discolor and Labisia pothoina, both exceedingly variable in form and colouring of leaf. I am now far away from the home of Œceoclades maculata, and can no longer make observations on it, but I think, when it comes to be studied in its native haunts, not merely from scanty dried specimens, or from isolated, often sickly, living ones, under quite abnormal conditions, we shall find that there is at present known but one solitary species of this curious aberrant genus, widely scattered over South America. *H. N. Ridley, Singapore.*

BELGIUM.

March Horticultural Meeting at Ghent.—Some very fine Orchids obtained a Certificate of Merit:—Dendrobium nobile Cooksoni, Rchb., of which the side petals resemble the lip, and are further remarkable for the large deep reddish-purple spot on their base; the general colouring is very noticeable. Cypripedium hyb. Boxalli ♀ × Chantini ♂, won a Certificate *par acclamation;* the dorsal sepal is very long, the base clear green, the whole surface marked with large blackish-purple dots, a broad white border, slightly spotted; petals with undulated borders, spreading at the extremity, well-formed, the general character of Boxalli, with the narrow petals of Chantini. Cypripedium hyb., Boxalli ♀ × Spicerianum ♂, dorsal sepal like that of Spicerianum, but more spreading: bright dark chestnut, gradually losing in intensity, and changing to purplish-rose, and finally to white; the extremity a pretty shade of green. It has the colouring of Boxalli mingled with the rose of Spicerianum, the rest of the flower resembles both parents, the fresh green foliage is very fine. These three beautiful Orchids were from MM. Ed. Vervaet et Cie.; Brassavola glauca from M. A. Van Imshoot; Odontoglossum Rossi majus purpureum, with the sepals and base of the petals very dark, from the same orchidist; Cattleya Trianæ var. Orion from M. Jules Hye, translucent bluish-pink petals, the midrib very plainly marked, the lip dark. A species of Odontoglossum from the same exhibitor, the lip of O. Alexandræ, sepals spotted, petals like those of O. Hunewallianum; Cattleya Trianæ white var., the petals very broad, the flowers variable; O. triumphans (*par acclamation*), also, like the former from M. Hye; the diameter of the flower nearly 4 inches, the width of the petals about 1 inch, colouring quite unusual.

Certificates of Merit were allotted for Azalea Jean de Kneef (a fixed sport of A. Archiduchesse Stephanie), a pretty flower of good form, clear flesh pink, edged with pure white, staged by M. Jean de Kneef; Aglaonema costatum to M. L. Desmet-Duvivier, leaves blackish-green, midrib wide, ivory-white, blotches irregularly distributed; Chorizema Lowi to the same nurseryman, flowers larger than those of the type, the colouring brighter and clearer, very floriferous; Vriesia brachystachys major, very pretty, raised from seed in 1884, from fruits obtained from Morrenia by Barillet. The same seeds gave Vriesia Leodiensis, Closoniana, &c. Brachystachys major differs from Leodiensis in its shorter spikes, and the curved bracts; it was sent by M. R. Grenier. Chrysanthemum Reine d'Hiver from M. L. Schmitz.

M. R. Grenier obtained a Certificate for cultivation and free flowering for a fine Tillandsia Van Volxemi; M. Jules Hye a Certificate of Merit, for a collection of Odontoglossum in flower, containing a very fine O. Andersoni superbum, O. excellens var. Hyeanum, O. Ruckeri var. Albertianum, and O. Wilckeanum.

The Ghent Quinquennial Exhibition.

The competitions for the best systems of heating will be of unusual importance, thanks to the energetic measures taken by the Administrative Council of the Société Royale d'Agriculture et de Botanique. The competitions will be so managed that the awards which are allotted will be substantial, and serve as a considerable inducement.

The annexe, which already rises in front of the old building, is on a large scale. A heating apparatus has been inserted which consists of a large boiler with about 8125 feet of pipes. The trial of the apparatus has already been made. Around the annexe many glass-houses are built, or in process of construction. In fact the industrial section of the exhibition bids fair to be a great success.

Orchids at Bruges.

We have seen in the houses of M. G. Vincke-Dujardin a very fine Lycaste found among an importation. The petals are cream-coloured, shaded with bronze; the interior of the sepals is of the same shade, terminating in reddish-brown; the exterior is cream-coloured. The dorsal sepal is gracefully recurved in front; the extreme tip is turned up and curved back outside. The lip is burnt-madder-coloured, the edges much fringed, and hairy. The bulbs are about 3¾ inches in height; the leaves 27 inches long by 3¾ inches wide, resembling those of L. Skinneri, clear green, the sides very conspicuous, being very pale green. Flower-stalk 27 inches long. The texture of all the parts of the flower is very similar to that of Lycaste Skinneri.

A very fine example of the beautiful Cypripedium Lathamianum, with eight flowers, remarkable for the brilliancy of its colouring, attracted my attention, as it was much more yellow than the type. So also did a great quantity of Lycaste Skinneri in bloom. One L. Skinneri bore a flower at least 6½ inches across, with a pure white lip; the petals bluish-purple, with a white border; the sepals white, veined with rose, and about 2¼ inches wide. Among the many Odontoglossums in flower, we must mention O. guttatum, of a wonderfully pure white, with large spots about ¾ inch from the extremities of the divisions; O. crispum, with rosy-lilac sepals, spotted with blood-red; very wide petals, waved, pure white, the lip white, with well-defined spots. A hybrid Odontoglossum, like Andersoni, profusely spotted with very dark spots; the base of the petals for about half their length bears dark spots, all run together, forming a hieroglyphic design. We must also record a fine O. Ruckeri, and two specimens of Cœlogyne cristata more than 3 feet across, and literally covered with flowers.

M. A. A. Peeters of Brussels has now in bloom the rare Lycaste Pœlmani, Cattleya Trianæ virginalis, which keeps its beautiful white colouring to the end, and the very rare Pleurothalis Roezli. *Ch. de B.*

RHODODENDRONS IN MARCH AT KEW.

The exceptionally open weather of the past few weeks has greatly favoured the development of our early spring-flowering shrubs, and there is at Kew just now (March 11) one of the finest displays of Rhododendron blossom that has been seen out-of-doors for some years. There are three species, and about as many hybrids in flower. First amongst them, by reason of its brilliant colour and generally striking character, is R. fulgens, a species introduced from the Sikkim Himalayas in 1851. The flowers are borne in compact, rounded trusses, about 4 inches across, almost every branch on the two shrubs now in bloom bearing a truss. Individually the flowers are 1½ inch across, and their colour is a deep and rich yet bright blood-red. This species is one of several in the Himalayan group, whose leaves are coated underneath with a reddish-felt. Sir Joseph Hooker, who figures and describes the species in his *Himalayan Rhododendrons*, says it is met with at altitudes of from 12,000 to 14,000 feet, and describes it as "one of the richest ornaments of these inhospitable regions, the flowers glowing like fire in the short hours of morning sunlight." It is not until June that it flowers on its native mountains, which is somewhat curious, seeing the little

encouragement it requires to burst into flower in this country. The two specimens in flower at Kew are planted in the Rhododendron walk near the Bamboo garden, and receive no protection of any kind, except that of surrounding trees.

R. Thomsoni is another Himalayan species, but comes into bloom a week or two later than R. fulgens. A plant, however, in the canvas frame near the conservatory (No. 4) has several corymbs already expanded. They are larger and more loosely arranged in the corymb than those of R. fulgens; they are also of a rich blood-red colour, but of scarcely so intense a shade as in that species. The leaves are elliptical in outline, glabrous, dark green above, and semi-glaucous beneath, and the plant altogether has a compact and shapely habit. It occurs at elevations of 11,000 to 13,000 feet. At Kew it is quite hardy.

R. dahuricum (spelt also dauricum and davuricum).—Loudon records the date of the introduction of this species as 1780, and Andrews gave a coloured picture of it in his *Botanical Repository* as far back as 1797. It is a native of Siberia, and exists in gardens under two forms—deciduous and evergreen; the latter, which is known as var. atrovirens, is flowering at Kew. It is a shrub of somewhat sparse habit, growing to a height of 4 to 6 feet. The leaves are small, oblong, and of a very deep green, whilst the flowers are bright rosy-purple, and measure 1½ inch across. In the *Botanical Magazine*, under t. 636, it is stated to be so abundant in certain parts of Siberia as to "empurple the mountain sides" when in flower. From this species, and the dwarf Himalayan species R. ciliatum, Messrs. Davies, of Ormskirk, raised the beautiful hybrid R. præcox, two bushes of which have been very beautiful at Kew for the last three weeks. The plant is fairly well known for early forcing, but out-of-doors is not often seen. It is unfortunate that the flowers will not bear more than 3° or 4° of frost, comparing unfavourably in this matter with R. fulgens.

R. altaclerense, many large shrubs of which are in full flower, was raised at Highclere in 1826, the first flowers appearing five years later. It was obtained by forcing R. catawbiense into bloom, to coincide with the spring-flowering R. arboreum, with the pollen of which the former was fertilised. About 1800 plants were raised from the first cross. It bears large and handsome heads of flower, the bell-shaped corolla being of a clear, bright crimson-rose, marked with darker-coloured spots. R. Nobleanum is another hybrid greatly resembling altaclerense, with flowers however of a darker shade of rosy-crimson. I do not know any record of its origin, but it certainly possesses the blood of R. arboreum; the other parent was probably R. caucasicum. Lindley gives a coloured drawing of a single flower in the *Botanical Register* for 1835. R. Govenianum is another of the same group, but in the specimens with which I am acquainted is distinguished by a dwarf spreading style of growth. It is just coming into flower at Kew.

Considering the very great beauty of all these Rhododendrons, it is a matter for surprise that they are not more planted. No doubt, the fact that a sharp frost occurring when once they are fully or even partly open, will seriously damage, if not altogether destroy their beauty, has operated to their disfavour. R. præcox is the most susceptible, whereas R. fulgens appears to be the hardiest in this respect of all here mentioned. Something can be gained by planting them in a position facing west, and screened from the morning sun for a sufficient length of time to allow the flowers to thaw before the sun's rays directly strike them. In spite of this somewhat hazardous tenure, I think they are deserving of more extended culture. At this season of the year it has to be a very poor flower indeed that does not give pleasure, and when such gorgeous masses of colour as these Rhododendrons give are to be had, it is worth while to run the risk of an occasional collapse. *W. J. B.*

Fig. 51.—Growth of Senecio sagittifolius in Uruguay. (see p. 355.)

SCOTLAND.

THE WEATHER IN THE ABERDEENSHIRE HIGHLANDS DURING 1892.

Mr. James Aiken, banker, Braemar, who has the charge of the meteorological instruments and the Observatory at Castleton of Braemar, Aberdeenshire, has just completed his annual detailed statement of records of the weather during the past year, and from his carefully compiled document, the following few notes are taken:—The Observatory stands in latitude 57° north, longitude 3° 24′ west; and the elevation of the station above sea level is 1114 feet.

Beginning with the thermometer, which is placed in air and protected, June has the highest reading, 76°; July, 74°; August, 71°; and September 61°; while the lowest occurred in February, 2° below zero. The highest mean temperature of the year was 60°, in July; August had 59°; September, 54°; and June, 58°. In sun the maximum records were:—July, 136°; June, 135°; August, 133°; May, 121°; September, 118°; and October, 106°. The direction of the wind for the year was principally south-westerly and west, which may account largely for the continued wet and damp weather experienced during harvest time. From due north the wind blew for seventeen days, and from due south for fifteen days; while from south-west and west its course extended over 222 days, and from north-east and east, 112 days. The highest mean pressure per square foot, 1·32 inches, was realised in January. For the year, the total rainfall only reached 28 inches—during harvesting operations, however, being 6 inches below the previous year, and 11 inches under 1890; so that, taking it all over, it was a hard dry year. August showed a rainfall of 3 inches; July, 2; and September, 3; while October had 5. April and May had the highest total sunshine.

ORCHID NOTES AND GLEANINGS.

CATTLEYA TRIANÆ var. GRAVESIÆ.

With the beautiful varieties of this lovely species now in cultivation, we seldom find one distinct enough to add to the already long list of names. The specimen before me is, however, an exception, and the only one which has come under my notice among many thousands, both here and in its natural habitat. The structure of both leaf and bulb is narrower than the type, the flower is large, the sepals and petals very pale pink, the latter very broad. The principal difference is in the lip, which instead of bordering on magenta or purple is (truly) bright red, pale rose over the column, with a dash of yellow in the throat.

Cypripedium × Hebe, *n. hyb.*

The result of hybridising C. Spicerianum with C. Stonei, and the inverse cross of C. Alice. Foliage much as in C. Spicerianum, of deep shining green, narrowing towards apex. The flower-scape is erect, slightly pubescent, 10 inches long, and monoflorous. In general structure the flower resembles C. Spicerianum; it is, however, more slender, and the petals are longer, the dorsal sepal much reflexed, hirsute, white, with a purple mid-vein, and Apple-green base. The petals are tinted with brown, a deeper band of brown extending from base to apex. Lip yellow-green, changing to yellow, tinted with brown, the infolded lobes lavender. Staminode octagonal, lavender-purple, with a yellow disc.

Cypripedium Tacita, *n. hyb.*

C. Measuresianum ♀, tonsum ♂. Foliage about 8 inches long, 1½ inch broad, dark green, with darker reticulation, suffused with vinous-purple beneath, particularly the midrib and base. Flower-scape slender, hairy, and brown in colour, bearing a single large flower 5 inches across; the ground-colour is sepia-yellow. Dorsal sepal veined with dark brown, margined white. Petals spatulate, naked on the superior margin, as in tonsum, a median line of brown extending to apex; lip rather acute, the side lobes long, and bearded on margin, the infolded lobes faintly spotted. Staminode obcordate, pale brown. The above two beautiful hybrids are now in flower in the choice collection of H. Graves, Esq., Orange, N.J. *R. M. Grey, Orange, N.J.*

Phaius Gravesii, *n. hyb.*

The result of a cross between P. Wallichii ♀ ×, grandifolius ♂, and the inverse cross of hybridus. The

seed was sown July 6, 1889, germinated December 1, 1890, and bloomed February 12, 1893. The general habit of growth and flower is like unto P. Wallichii. The flower is 5 inches across. Sepals and petals cinnamon-brown, the reverse side white. Lip pink-rose on front, a white line extending to apex; the part enfolding the column is white, with a yellow keelson. Column pure white. The name is complimentary to H. Graves, Esq., Orange, N.J. *R. M. Grey, Orange, N.J.*

Odontoglossums from Rosefield.

From his gardens at Sevenoaks, Mr. De B. Crawshay, that clever cultivator of good showy Orchids, sends four very distinct Odontoglossums. The first, O. Andersonianum album, has flowers approaching in breath of petal O. crispum, and of a clear wax-like white. The halves of the segments nearest the column are spotted with red, the marking on the petals being disposed much in the same manner as in O. hebraicum. The lip, which is peculiar in form, is light yellow, passing to nearly white at the apex, and with five or six small red spots. The second, O. Wilckeanum, Rosefield var., is 4 inches across the extended segments. The flowers are bright light yellow, with three large brownish-red blotches on each petal, and still darker markings of the same hue on the sepals, the lip having one large and some smaller red blotches. The third is O. Hallii nigrum, a superb flower; and the fourth a good form of the O. triumphans section, which it is supposed may be another cross with O. excellens, as the crest is large, the lip flat, and without the apiculus seen in the type.

Cultural Memoranda.

ANTHURIUM SCHERZERIANUM.

These plants, and others similar, which we grow in our stoves for the quaintness of their spathes, should be merely surfaced at this season with lumpy peat, loam, dried cow-dung, charcoal broken into small pieces, with the dust, and a good proportion of sharp sand, first removing the upper crust of exhausted materials. Turn them out of their pots or pans, and put the drainage in good order, but without further disturbing the roots. Potting is best performed after flowering. As soon as the spathes appear, abundance of rain-water should be applied, and twice a week a dose of mild liquid manure, the plants being shaded from direct sunshine. To preserve the spathes for the longest time possible in good condition, they should be moistened slightly three or four times a day with tepid water. This kind of treatment is suitable for all the species which are grown for the sake of their brilliant or quaintly-formed spathes, as A. Scherzerianum and its varieties Dixoni, giganteum, Rothschildianum, Wardii, Williamsii, A. Patini (a dwarf species, with white spathe), A. Lindenianum, Andreanum, and others. *G. Parrant, Ashby Lodge, Rugby.*

The Week's Work.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

PLANTS SUITABLE FOR GROWING IN PAIRS.—It is often necessary for decorative purposes to grow some varieties of plants in pairs. These should be selected while quite young, and afforded a uniform kind of treatment, and for this purpose the inmates of the greenhouse are those usually found the most suitable for being moved from one place to another with least risk. Some of the best are Araucaria excelsa, Aralia Sieboldi, Dracæna australis, D. indivisa, Bambusa arundinacea, Myrtus angustifolius, M. communis, M. flore plena, M. Jenny Reitenbach, Diosma gracilis, Phormium tenax, Chamærops excelsa. Of warm-house subjects for this purpose, I would mention Kentia Forsteriana, Musa ensete, for a pair of noble plants, Musa Cavendishii, and Cycas revoluta. Plants of Aralia Sieboldi needing to be repotted should be attended to forthwith, before new leaves form. A suitable soil for this plant is loamy-peat and leaf-mould, in about equal proportions, with plenty of sharp-sand. Seeds of this plant may be sown at this season in mild heat. I do not find the variegated-leaved variety of Aralia Sieboldi so useful or hardy as the plain-leaved.

PELARGONIUMS.—The present is a good time to increase the stock of the sweet-scented varieties. There are many good sorts worth growing. Among the best are Lady Scarborough, Citriodorum crispum, the old Oak-leaved varieties, Fair Rosamond, Fair Ellen, Little Gem, and Prince of Orange. Cuttings of these should be taken about 3 inches long, and put into sifted loam and leaf-mould in about equal parts, with a good portion of sea sand. The best pots for the purpose are 5 or 6 inch. Drain well, and fill the pots within 1 inch of the top with the prepared soil, and cover with a layer of sand. Place the cuttings round the sides of the pots, and put them into the Cucumber-house or propagating pit. Shade from bright sunshine. They will soon strike in a temperature of 70°. When struck, pot off into small pots, and keep them in heat till they have made a good start. The one most in demand is Lady Scarborough; it requires good attention to keep it in condition for cutting from during the winter months. If over-watered it will soon turn yellow, and it must not be cut too hard. The flowers of all the scented varieties should be picked off, with the exception of the variety Prince of Orange, some plants of which should be grown with the show Pelargoniums. The Citriodorum, lemon-scented, nutmeg-scented, peppermint-scented, rose, orange, clove, and the many other varieties, are easy to grow for cutting purposes. Plants that have been cut hard should now be pruned, and kept rather dry for a time, to get them to break well, then shook out of the old soil, and repotted into clean pots. Use plenty of drainage, and give them good loam, leaf-mould, and sand, with some dry cow-dung mixed with it. After potting, they may be kept warm for a time in house or pit, and when danger of frost is over, they can be turned out into the plant-yard for the summer months. Plants of any of the zonal varieties that have been flowering in pots during the winter, should be cut back, and kept dry for a time, then shook out and repotted into good loam and horse-dung, and grown on in pits or frames until they can be turned outside, when they may be plunged into ashes till wanted. Cuttings of these will strike well now in pots or boxes in a warm vinery or forcing house. Give careful attention to the show and fancy varieties, and where the pots are full of roots give good waterings of well-diluted manure, or clear soot water, twice a week. Train out well as they grow, and give abundance of air. Fumigate with tobacco cones, rolls, or sheets. No fire is needed to light any of these, and no attention is necessary after placing them where required.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

ONCIDIUMS, ETC.—O. macranthum, O. lamelligerum, O. undulatum, O. serratum, O. cucullatum, and Odontoglossum ramosissimum are species which require to be cultivated at the cooler end of the Odontoglossum-house, and be so placed that fresh air in abundance will pass through and among them in weather favourable for ventilation, both bottom and top ventilators being open. There should also be plenty of moisture about, the syringe being plied amongst them as well as overhead. The temperature should range from 45° to 50°. In potting these plants, three-parts fill the pot with clean crocks, and finish off with a compost consisting of equal parts good Orchid peat and living sphagnum moss, slightly raising the mass above the rim. Sometimes yellow thrips will give trouble, but if previous recommendations are carried out, as for Odontoglossums, these insects will soon be got rid of. The flower-spikes are now making their appearance on these species, and snails and woodlice must be searched for at night when they are feeding. Lycaste Skinneri and L. S. alba are plants that do well with the Odontoglossums, but they require to be kept a few degrees warmer, that is, they must be placed at the warmest part of the house, and well shaded from strong sunshine. The foliage of these Lycastes is apt to become spotted, which I find is caused by too strong light. They are now in bloom, and are very useful for cutting, lasting quite one week, and re-potting should be done after the flowering is past. The best compost for them consists of peat, fibrous loam, sphagnum moss, and clean crocks, with which the pots should be half filled. When well-established and growing, plenty of water should be afforded them. Anguloa Clowesii, A. eburnea, A. Ruckerii, A. R. sanguinea, and A. uniflora are species best worth growing. These plants are about to start into growth, and along with the new growths the flower-spikes ascend together. Our Anguloas are placed in the plant stove till partly made up, when they are removed to a cooler and more shady house to mature their pseudobulbs. I find that they succeed more satisfactorily in a house heavily shaded during the period of growth, and we afford them a long rest afterwards. Ours were rested with the Dendrobiums, and are now removed to the north side of the stove. In potting, employ the same compost as for Lycastes.

DENDROBIUMS, ETC. — Dendrobium Bensoniæ swelling their flower-buds will now require a little extra moisture at the roots and in the atmosphere, but it is rather too early to place them in their growing quarters. We give them a higher temperature during the resting period than the D. nobile section by about 5°, and place them in the hottest position during growth. D. Dearei are now completing their growth, and the flower-buds are already swelling. This is a good variety for flowering in June, but it is one of the more difficult ones to grow. It will be found best not to give it any rest at all, excepting for a period after it has made its growth, when it may be kept rather drier, but not too much. We grow ours during winter in a temperature of 65° at night, and in summer 75°. If in a healthy state during growth, they will take abundance of water, both at the roots and overhead, with as little shading as possible. D. Phalænopsis, D. P. Schroderianum, D. bigibbum, and D. superbiens do well in the same house, and with the same treatment as D. Dearei. D. Phalænopsis and D. P. Schroderianum should be carefully watched now for the destructive weevil which was imported with them, for these will soon be making their appearance again if any were missed last year. The safest plan is to cut an affected pseudobulb clean away, as neither fumigating nor dipping will kill them. D. Chrysanthum, well advanced in growth, must not be neglected. Give plenty of water and a high temperature, and hang close up to the roof-glass. Epidendrum bicornutum should now have their flower-spikes well advanced, and they must be copiously supplied with water until the flowers are developed. This plant requires the hottest end of the Dendrobium-house to grow it successfully, and when well grown, it is a most beautiful Orchid. The roller-blinds may have to be used for a few hours during the brightest part of the day, but roll them up early in the afternoon.

FRUITS UNDER GLASS.

By M. Temple, *Gardener, Carron House, Stirlingshire.*

THE GRAPE-ROOM.—Where Grapes have to hang till May, let the temperature (if possible), not exceed 50°, and remember that a current of dry air will soon render the fruit useless; often examine the bunches, removing decayed berries, if any, before they injure others, and fill up the bottles with clean water when necessary. Grapes with us have never kept better than this season, the loss being nominal, and the fruit is as fresh-looking as in September.

PEACH FRUIT-BUDS DROPPING.—From the numerous cases met with of Peaches and Nectarine trees dropping their buds, it looks as if we have not found the cure for this matter. It is sound instruction to advise the lifting and replanting of Peach trees, and I well know its good effects in maintaining the health and fruitfulness of these trees. I may also add, that I have myself proved the beneficial effects of raising the roots of every kind of fruit tree known in British gardens, and seen canker and other evils cured again and again by it. I am not quite sure that Peach trees and Nectarines which drop their fruit-buds apparently as a matter of course can be induced to retain them, and think that some varieties, at least, are incurable. All our Peaches and Nectarines which set their fruit during the month of January retain every bud, and must be rigorously thinned. In the second Peach-house, however, there is on the front trellis a Hardwick Nectarine which retains no more buds than make a moderate crop of fruit, which is in company with Peaches and other Nectarines which never drop a bud. A Peach, Belle Beauce (in company with trees on a back wall) sets badly, while its fellows drop no buds. It would be interesting if cultivators would give the names of bud-droppers.

MELONS.—Those recently planted keep somewhat close till they are in active growth, then in-

crease air daily as weather permits, but shut up early to harvest sunheat, allowing the temperature to rise to 85°. Keep surfaces moist, and when they require water give sufficient to reach all the roots. Increase the air in earlier houses. Stop shoots when about 3 feet long; take off or stop laterals, allowing two to show fruit on each main-stem. Do not wet fruit bearing flowers, but impregnate them as they open; prevent crowding, and allow the heat to fall to 65° at night when weather is severe. Mats may be used to save the severe use of fire-heat. If manure supplies the necessary warmth, keep linings regularly made up. In Melon-houses one stem to a plant answers well, and all laterals near the base should be closely stopped. Add fresh soil to the roots before they are checked by exposure, for this induces red-spider. Those in pots will require abundance of water. If they are on shelves, a pan filled with good loam, bone-meal, and some well-broken charcoal, made thoroughly firm, may be placed under the fruiting pots, to allow fresh feeding space for the active roots. We get good crops from 9-inch pots placed in some of 12-inch; they root readily through the enlarged holes in the bottom. Canker at the collars rarely attacks such plants. Pot or plant-out into firm soil succession plants as soon as ready. Any check in the early stages of growth is injurious. Now is a good time to sow a main crop for summer.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

REPLENISHING SOIL-HEAPS.—If fruits of the finest description are desired from old gardens, it is occasionally necessary to replace some of the garden-soil with virgin-loam or other substitute, and it is also advisable to plant all young trees into something of this description. Where such can be obtained from park or other old pasture-land, all the better; but, failing this, in most districts permission can generally be obtained from the road-surveyor to take the turf-soil and scrapings from roadsides, and this is a good substitute for the loam from pasture-land. Now is the time to obtain this, that it may be ready for use in the autumn; also reserve a good supply of burnt garden-refuse, now being made from fruit-tree and shrub prunings, and other garden refuse.

FRUIT TREES IN BLOOM.—Apricots, Peaches, Plums, and Sweet Cherries on walls are a fortnight earlier than they have been for some years, so that the greatest care will be necessary in protecting the bloom. The borders were thoroughly moistened by the rains during February, which will render unnecessary any waterings for some time to come, and thus with the surface in a dry state, and the trees protected according to former directions, nothing less than 12° or 14° of frost should injure the bloom. Bush trees that are also in bloom are more difficult to protect. Bracken placed thinly and lightly among the branches is displaced by the first gale of wind. Covering over the quarters with two or three thicknesses of netting, strained over wires upon posts, is an excellent protection; but having had netting thus used spoiled by being broken with heavy snow, my aim has been to plant bush fruits where they receive shelter from the north and east by large standard fruit or other trees, and thus minimise the necessity for any further protection.

THE FRUIT ROOM.—To keep Apples plump and juicy till the end of May, reduce considerably the ventilation, leaving only sufficient to prevent damp impairing the flavour of the fruit. An ideal room to keep Apples in good preservation after March 1, should be sunk 2 or 3 feet below the ground level, with thatched roof running down to within 1 foot from the ground.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

ROSES.—Should mild weather occur during the next week, all Roses should be pruned, but under reverse circumstances it will be as well left a short time longer, for if this is done too early, the young shoots may get injured or killed by sharp frosts. The pruning should be such as to thin out the growths, and cut out all weak shoots, to admit air and light. The more vigorous ones should be cut back to four or five buds, but should the plant be at all weakly, cut back to one or two buds. These remarks apply chiefly to standards of the hybrid perpetual section. In the case of Tea Roses, it is advisable to give more encouragement to the strong shoots which form occasionally, of course by so doing the symmetry of the heads is lost; but at the same time, if fine blooms are desired, some of the most prominent and advanced buds on vigorous shoots must be left to produce them. Bush Roses should be allowed greater freedom. The weak useless branchlets should be cut out, and the more vigorous ones shortened to about half their length. Such varieties as Gloire de Dijon, Maréchal Niel, Devoniensis, Homer, and Blairii No. 2, flower grandly from the strong shoots if shortened back to well-ripened wood. Austrian, Persian, Yellow, York and Lancaster, Damask, and other varieties, should be pruned very sparingly. After the operation is finished, lightly fork over the beds, taking care not to injure any of the roots, and a good dressing of rich soil or short well-rotted manure would also be beneficial to them.

HERBACEOUS BORDERS.—These should be looked over again, and if the ground remains dry a good hoeing is very beneficial to the plants; and it will kill hundreds of weeds which are now coming up, and will save a lot of trouble later in the summer. Any seeds of hardy annuals, &c., required should now be sown, using a little fine light soil to cover the smaller seeds. Sweet Peas, Virginian Stocks, Candytuft, Godetias, Clarkias, Nemophilas, and a host of other equally beautifully flowers are useful for summer display. Beds containing spring-flowering plants, such as Silene, Arabis, Polyanthus, Aubrietias, &c., will be benefited by another careful hoeing. The same remarks apply to beds of Hyacinths, Tulips, &c. Any tubers of Ranunculus intended for a late display should now be planted; they look best if planted by themselves in a bed about 1½ inch deep and 4 inches apart. Seeds of half-hardy and tender annuals should be sown in boxes or pans, placing them in heat until the seeds germinate. No time should be lost in completing the potting-off of all autumn-struck Pelargoniums intended for bedding, keeping them in a little heat till root-action has commenced. The tops of old plants strike very readily now in sandy soil in a warm house or frame, if sufficient were not obtained in the autumn. Ivy-leaved varieties strike readily in a gentle heat, and some of the old plants if potted and trained to a globe-trellis, or three or four stakes in the form of a pyramid, are useful in the same way as specimen Fuchsias.

THE APIARY.

By Expert.

STIMULATING COLONIES.—It is full early to commence stimulating with syrup, although we have had weather warm enough lately to enable the bees to take food in this form. How long it may last, however, is another matter, and therefore candy, which the bees are able to consume without cessation, should be continued for the purpose of inducing increased rearing of brood. A simple and capital recipe for making candy lately appeared in the pages of the *British Bee Journal*, and may with advantage be repeated here. If the directions are closely followed, a most suitable soft candy with a fine grain will be the result. "Into a large copper-bottomed saucepan put three imperial pints of boiling-water, then add gradually 17 lb. of pure Demerara crystallised-sugar, into which one and a half teaspoonfuls of cream of tartar has been mixed; stir well till all the sugar is dissolved, then allow it to boil ten to fifteen minutes. Now stand the saucepan of syrup in a vessel of cold water, and stir briskly until it gets of a thick, creamy consistency. A little salt may be added, if desired, just before it is removed from the fire." Before the candy is ready to pour out, moulds should be got ready for it. Soup-plates containing brown paper answer very well, and the cakes thus made will weigh about 2 lb. each. It will also be advisable to stir in pea-flour when the candy is taken off the fire.

EXAMINING HIVES.—Any warm day should be taken advantage of to go carefully over all the frames in each stock, noting the extent of the stores, as a guide to future feeding, and weeding out irregular combs, and those containing drone cells. The operation should be done as expeditiously as possible, so that the hive is not kept open long enough for any brood to get chilled. The tops of the frames should be cleansed of any wax that may have been built on them, so that the quilt will then fit down tightly. A triangular scraper, such as is used by painters and glaziers, is an excellent little tool for this purpose.

THE WELLS SYSTEM.—In a conversation with Mr. Wells a few days back, he stated that his stocks in double hives were in good order this spring. Some must be exceptionally so, for he said that he had been obliged already, in some cases, to give additional breeding space to hives containing fourteen standard frames, as the bees were so crowded that they had not room enough to subsist. He expressed an opinion that a hive made to carry out his system properly should consist of three chambers, each to contain twenty standard frames. The bottom one would be devoted entirely to the two queens for breeding purposes, divided in the middle by the perforated board, the two upper ones being used for storing the honey. The holes in the perforated division-board he makes half an inch apart, and nearly an eighth of an inch in diameter.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

CARROTS.—This is often a troublesome crop, especially in old or neglected gardens, where probably the Carrot-maggot (Psila rosæ) is prevalent; and as these little creatures work their destruction underground, it is difficult for the cultivator to see the extent of the mischief until too late. There is seldom any difficulty in growing early varieties, which are drawn as soon as ready for use. It is the main crop that so often suffers; and where this is so, it is preferable to sow only quickly-growing kinds. Sowings should be made at intervals from now to August, according to requirements; only sufficient should be sown each time to keep up the necessary supply. It is not a good plan to use fresh manure for this crop; artificial manure may be used either when sowing or thinning, but we prefer using it on the soil before it has been raked down for sowing. Kainit, at the rate of 3 lb. to the rod, will be found beneficial, and if a further dressing of soot or wood-ashes can be given, this will be of further assistance.

CELERY should be pricked off into a gentle hot-bed as the plants get forward enough to handle, they will then be far more robust. If allowed to be over-crowded, they seldom give satisfaction. Celeriac must also be attended to, and not allowed to remain too long in the seed-pans.

VEGETABLE MARROWS.—Where these are required early, a sowing may now be made. See that the plants are kept near to the glass.

TOMATOS.—Pot-on and keep near the light, admitting air on all favourable occasions to keep the plants stocky. Those fruiting should have a warm dry atmosphere to assist the flowers to set. Give the plants a gentle tap in the middle of the day, when the flowers are dry, to scatter the pollen. Remove all lateral growths as they are formed, so that flowers and fruit may have all the light and air possible.

CAULIFLOWER.—Plants which have been protected in cold frames may now be planted out in warm sheltered situations in the south. But in exposed places it will be better to wait another week or ten days; for if these plants receive a check, they often bolt. The ground should be heavily manured to obtain satisfactory results. Attend to those on hot-beds, and see that they do not become over-crowded, or suffer from want of water. If the soil used for these was obtained from a refuse heap or old potting material, care must be taken, for such soil is often infested with the larvæ of the crane-fly.

PEAS.—Those that have been raised in frames, to be planted out eventually, may now be transferred to their open quarters. Take the precaution to choose a mild dry day for the work, so that they may not suffer any injury from exposure to drying winds. After planting, sticks should be put to them at once, and Spruce or other evergreen boughs placed alongside for shelter. See that the plants are well moistened before turning them out of the pots.

HERBS.—There should be a supply of all such kinds as Chervil, Basil, Savory, and Borage, for these are often in great demand, especially the former, and as they soon go to seed, frequent sowings are necessary.

SALSAFY.—Make a sowing in shallow drills 15 ins. apart. The ground should be treated as recommended for Carrots, or the roots will not grow straight.

SCORZONERA may now be sown, the ground having been deeply dug, as advised for Salsafy. Sow in drills, taking care not to cover too deeply.

SMALL SEEDS.—Do not fail to make requisite sowings of Mustard, Cress, Radishes, Lettuce, Turnips, and Spinach. Dust with newly-slaked lime those that are appearing above the soil, except the two former. This will ward off birds and snails.

EDITORIAL NOTICES.

Letters for Publication.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* written on one side only of the paper, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to return unused communications, or illustrations, unless by special arrangement.*

Plants, &c., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Illustrations.—*Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, Mar. 28 — Royal Horticultural Society, Drill Hall, James Street, Westminster. Lecture at 3 p.m., by M. H. Vilmorin on "The Flowers of the Riviera."

SALES.

MONDAY, Mar. 27 — Calceolarias, Gladioli, Pancratiums, Dahlias, &c., at Protheroe & Morris' Rooms.

TUESDAY, Mar. 28 — Home-grown Lilies, Begonias, Anemones, Carnations, and Orchids, from Messrs. F. Horsman & Co., and others, at Protheroe & Morris' Rooms.

WEDNESDAY, Mar. 29 — Japanese Lilies, Azaleas, Roses, Gladioli, Herbaceous Plants, &c., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—44°.8.

The Anatomy of Hybrids.*

A most important contribution to science has lately been made by Dr. Macfarlane; for, though others have investigated some special cases of hybrids, the author has done it in a more thorough manner, and furnished a model for future investigators. He has described a large number, and taken Philageria ×, and its parents, Lapageria (female), and Philesia (male), as a typical case for an exhaustive treatment. From this and others it appears that two results may follow. Special characteristics of one or both parents, e.g., of hairs, glands, &c., may appear unaltered in form, but reduced in the hybrid offspring; this he calls uni- or bi-sexual hybridity while other structures, common to both, may be more or less intermediate, e.g., the thickness of the cortex, number of stomata, &c. This agrees with the observations of M. Vesque in his study on anatomical characters in the classification of plants (*Bull. de la Soc. Bot. de Fr.*, 1889, p. xli.), in which he groups the characters as "qualitative" and "quantitative."

A most important point to be observed for any organs to be exactly comparable on each of the three forms, is that they must be in identically the same stage of development, otherwise grave errors may creep in, as, e.g., the number of cells and of stomata on a leaf-surface decreases with age over the same area, while the thickness of the cuticle increases.

Dr. Macfarlane has described Philageria very minutely, comparing it with its parents in about thirty points; but it would have been preferable to have tabulated the results, as it is more impressive to the eye to see them at a glance. So far as we have seen, in no case is the absolute mean exactly hit by Philageria, and the excess or deficiency above or below the mean varies considerably. Thus, it is seven times in excess, and six times below it, between 1 and 5 per cent. It is twice between 6 and 10 per cent. above, and thrice below it. Lastly, it is about seven times in excess and thrice below it, above 10 per cent.

Again, by tabulation, other results become more apparent. Thus, e.g., the thickness of the epidermal cells and of the endodermal cells in the root, and the lamellæ of the cortical cells of the stem, and the indurated cells of the fibro-vascular cords of the leaf, are all attributable to the male parent Philesia, thereby showing its prepotency in this particular feature.

Again, of all the details of the roots (taking means where the author has given ranges), seven incline to the female, three to the male parent; of the stems, the proportion is four to five; and of the leaf, four to six. All together, the hybrid has fifteen in favour of Lapageria and fourteen, of Philesia.

In order to show the exact position of the hybrid at a glance, the true mean should be added (obtained by multiplying the numbers corresponding to the parents, and extracting the square root), as well as the percentage above or below the mean. The following examples will show this advantage, + or — indicating excess or deficiency per cent.; and the arrows point to the stronger parent:—

Root.	Lapageria.	Philageria.	[*True Mean.*	*P C.*]	Philesia.
No. of thick layers of cort.	9	←4·5	[4.2	—0·7]	2
Scl. elements (div. micr.)	20	←33·5	[34·6	—3·1]	60
Stem.					
Out. layers of cortex.	22·5	←16	[14·6	+9·5]	9·5
Diam. of f.v.b. (div. micr.)	400	250→	[275	—9·1]	190
Leaf.					
Pet. f.v.c. (no. div. micr.)	7	←5	[4·5	+11	3
Up. meso. pal. layer.	3·5	2→	[2·6	—23]	2

The importance of adding the true means will be seen readily in such cases, as when the hybrid and its parents are represented as follows:—♀ 5; hyb. 4; ♂ 3 (as in the cells of the innermost layer of the cortex of the two species of Dianthus and its hybrid D. Grievei (p. 222); for it is impossible to say from these numbers towards which parent the hybrid inclines. If, however, we read it thus, 5; 4; [true mean 3·87] 3: we see that it slightly inclines towards the female parentage. As another example, the author gives the sizes of the pitted vessels of the stems of Ericas, as (♀) 12 to 15 div. micr., (♂) 20 to 22 div. micr., and of the hybrid as 16 to 20 div. micr. These do not show at a glance to which parent the offspring inclines. Taking the averages, the figures stand thus, 13·5; 21; 18; the square root of 13·5 × 18 is 15·5. Hence, the hybrid is considerably nearer the male parent than the female.

The author gives a critical examination of Cytisus Adami, which shows well the importance of this method of investigation in its aid towards solving doubtful cases; for he comes to the conclusion that it is "a graft hybrid of pronounced type."

Space will not permit of further allusion to the interesting problems discussed by the author in connection with hybrids; but he finally raises the important question as to whether a study of anatomy may not be able to decide between a supposed hybrid and an intermediate variety. Admitting the impossibility of arriving at absolute certainty, he says:—"In any case, we consider it as undoubted that recognition of hybrids from careful microscopic study should now be possible in the great majority of cases."

Mr. Henslow, we believe, is engaged in similar investigations into the anatomy of the composite hybrid Rhododendrons raised by Mr. Veitch, and finds precisely the same features, in that one or the other parent often impresses some special peculiarity upon the offspring (sexual hybridity), or else common characters are more or less intermediate. An original parent may be subsequently more or less eliminated altogether, or ancestral characters may re-appear, and so on. Further details must be reserved for a future occasion.

* *A Comparison of the Minute Structure of Hybrids*, by Dr. J. M. Macfarlane.

Cœlogyne Sanderæ.—This beautiful species, which was exhibited at the Royal Horticultural Society on March 14, when it was awarded a First-class Certificate, seems to be the best of that section of Cœlogyne to which the old, but still rare C. Cumingii and C. trinervis, and the newer C. Fœrstermanni belong. Moreover, it is very free-flowering, and produces its flowers on much smaller plants than either of the species named. The pseudobulbs are ovate-conical, often compressed so as to exhibit four angles, and the bright green leaves are ovate-lanceolate. The flowers, which are produced in elegant sprays, are pure white, the labellum fringed, and white at the edge; the centre orange, with three intense maroon-coloured fringes running from the base. (See fig. 52). *J. O'B.*

Linnean Society.—At the meeting held on Thursday, March 16, Professor Stewart, President, in the chair, the Rev. J. Bafton, Messrs. R. T. Baker, J. Taylor, and W. H. Wilkinson, were elected Fellows; Mr. F. W. Moore was elected an associate; Mr. W. G. Ridewood was admitted. A curious freshwater Alga, growing in a perfectly spherical mass, without any visible point of attachment, and described as an "ægagropilous" condition of Cladophora, was exhibited by Mr. A. W. Bennett, who stated that specimens had been found in English and Welsh lakes, as well as in Sweden, and that the peculiar spherical form of growth was difficult to explain. Mr. G. R. Murray suggested that it might be due to the action of a current which would cause a continuous revolution of the mass. Mr. G. F. Scott Elliott gave an interesting account of the botanical results of the Sierra Leone Boundary Commission, and of the collections made by him during five months' travelling. His remarks were criticised by Messrs. J. G. Baker, C. B. Clarke, W. Carruthers, and Dr. Stap, who was present as a visitor. Messrs. G. R. Murray and Horace Monckton offered some remarks on the similarity in certain respects of the fauna and flora of the West Coast of Africa and the East Coast of South America, with reference to the statements made by Mr. Pocock and Mr. Scott Elliott. The meeting adjourned to April 6.

Royal Horticultural Society.—The next display of fruits, flowers, and vegetables will take place in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, March 28, when the various committees will meet at 12 o'Clock as usual. At 3 p.m., Mons. Henry de Vilmorin, of Paris, will deliver a lecture on "The Flowers of the Riviera," which is sure to be interesting.

Fig. 52.—Cœlogyne sanderiana: flowers white, with a deep purple lip. (see p. 360.)

Gardeners' Royal Benevolent Institution.—We have great pleasure in publishing the following letter from a gentleman who has long been a subscriber to the Institution:—"Sincerely sympathising with the cases of John Butler and Jane E. Nichols, who have been unsuccessful candidates for the pension of the Institution at the last five annual elections, it is my intention to place at the disposal of the committee—and I hand you a cheque for £36 herewith—the amounts necessary to provide for the present year the allowances to which they would respectively have been entitled had they been elected in January last; at the same time I earnestly hope that special efforts will be made to secure their election on the next occasion." Another gentleman, who desires his name to be withheld, has handed the Secretary £5 5s. for an exceptional case of suffering and distress which was recently brought to the notice of the committee. *O, si sic omnes!*

Tasmanian Apples for England.—Reports as to the quality and extent of the Tasmanian Apple crop, and of that in New South Wales, &c., have for some few months past been somewhat contradictory, and this lack of exact knowledge extends even to the office of the Agents-General here. Failing his ability to give trustworthy information as to quality, Sir E. Madden, K.C.M.G., the Agent-General, gives the following figures relating to the quantity to be shipped from Hobart this season: the first column of the appended table gives the date of shipment in the vessels named in the second column, the third column gives the quantities, as follows:—

February	20,	per s.s.	Britannia ...	...	9,000 cases.
,,	27	,,	Ophir ...	...	14,250 ,,
March	6	,,	Himalaya ...	...	8,700 ,,
,,	13	,,	Orizaba ...	...	13,750 ,,
,,	20	,,	Massilia ...	...	22,150 ,,
,,	27	,,	Oroya ...	...	13,750 ,,
April	3	,,	Oceana ...	...	9,750 ,,
,,	10	,,	Orient ...	...	15,500 ,,
,,	17	,,	Arcadia ...	...	9,800 ,,
,,	24	,,	Ormuz ...	...	11,000 ,,
				Total	127,650 cases.

Of course, it does not follow that these figures will be adhered to. Last year, it may be remembered, there was a disparity on the minus side, with which the officials at Westminster had nothing to do.

Amateur Gardeners' Association.—The fourth ordinary meeting of this association was held recently at the Temperance Institute, Birmingham. A paper on "Roses" was read by Mr. W. Dean. As indicating the development of the Rose, he produced a catalogue of 1820 giving 119 kinds of Roses for summer blooming, all, with the exception of a very few in old cottage gardens and the older gardens of noblemen and gentlemen throughout the country, now out of cultivation. In 1834, 278 varieties were named. In 1856 a few autumnal Roses had been introduced. In 1863 seventy new sorts were brought in, but only a few, including John Hopper and Lord Macaulay, were still in public favour. In that year there were in twenty-seven sections 1000 varieties. For out-of-door growing in large towns like Birmingham, he argued that the selection should be made only of such sorts as were of a free-growing character and free-blooming. He recommended for such culture Alfred Colomb, Baroness Rothschild, A. K. Williams, Charles Lefebvre, Camille Bernardin, Countess of Rosebery, Duke of Teck, Dr. Andry, Duke of Edinburgh, Dupuy Jamain, Earl of Dufferin, Ferdinand de Lesseps, Fisher Holmes, François Michelon, Louis Van Houtte, Madame Marie Verdier, Madame Victor Verdier, Marie Baumann, Mrs. John Laing, and Pride of Waltham. A good loamy soil was the Rose-grower's aim. He recommended planting as early as November, gave illustrations of pruning different varieties, and described the different stocks upon which Roses are worked.

Bath Chrysanthemum Society.—The exhibition for the present year has been arranged for November 8 and 9.

Allotment Gardening in Nottingham.—At the invitation of the Nottingham Garden-Holders Association, Mr. Richard Dean, of Ealing, delivered, on the evening of the 17th inst., a lecture on "Fruit Culture for Cottage and Allotment Gardens," illustrated by diagrams, the sorts of fruit recommended for the district having been selected by Mr. William Ingram, Belvoir Castle Gardens, Messrs. J. Cheal & Sons, Crawley, kindly supplying samples of most of the Apples named by Mr. Ingram. The chair was taken by W. Wagstaff, Esq. Mr. Dean's address was well received, a number of questions were put and answered. We regret to learn that a serious accident happened to Mr. Dean, on being driven the following day from Belvoir Castle to Redmill Station, the

horse attached to the conveyance bolting, and throwing Mr. Dean and the driver heavily into the roadway, severely cutting their faces and injuring their limbs. Both are incapacitated from active work for a time.

Frost at Belvoir.—Mr. William Ingram reports that severe frost prevailed in the Belvoir district for four days—viz., March 18th, minimum, 31°; on the grass, 26°. 19th, minimum, 21°; on the grass, 14°. 20th, minimum, 25°; on the grass, 18°. 21st, minimum, 28°; on the grass, 19°. Such Rhododendron blooms as were expanded are quite blackened.

The Insect Friends and Foes of the Garden.—Such was the title of a lecture to the members of the Birmingham Gardeners' Association, on the 13th inst., by Mr. C. E. Pearson, of the Chilwell Nurseries, and the subject attracted a large attendance of members. Mr. Pearson went thoroughly into a description of them, illustrating with lantern slides the appearance of each, and giving its history from the egg, or larvæ state, up to its full development, and describing the food requisite for its subsistence. Advice was given as to the habits of each, and modes of extermination, but exempting some few, which he described as preying upon each other. He strongly urged a study of entomology, as being so useful to gardeners, and the lecture throughout teemed with useful information. At the same meeting Mr. Deans, a young member, exhibited specimens of Anastatica Hierochuntina, or the Rose of Jericho, and dried specimens of Resurrection Mosses, or Selaginellas.

Aconite and Celery.—A curious case of poisoning by Aconite, says the *Pharmaceutical Journal*, occurred at Martham, Norfolk, lately through a farm labourer eating some Aconite-root, which he had taken home under the impression that it was Celery. According to the report, the deceased spat out the root directly after biting it, yet death supervened in a few hours. A specimen of the plant has been sent to our contemporary by Mr. Nuthall, of Norwich, and, at first glance, possesses a striking resemblance to the small heads of Celery at present to be seen in the London market; but, on closer inspection, the characteristically-shaped leaves and root leave no doubt as to its identity. A singular confusion was indicated in the evidence of the local doctor, who spoke of the deadly Nightshade and Aconite as one and the same plant! As a result, the verdict of the jury incorrectly stated that "deceased died through having eaten deadly Nightshade through misadventure"!!

"Kew Bulletin."—As an appendix to the volume for 1893, a list of the new garden plants of the year 1892 is given. There is a difference of procedure in the use of capital initial letters in the case of personal names which is rather confusing, thus, "Cymbidium winnianum" and "Chionodoxa Luciliæ," "Calanthe sanderiana" and "Cattleya Alexandræ." As this is so throughout, it would seem as if there were some underlying principle. Critical notes are occasionally given, which will be so useful that we can but wish there were more of them, thus, under the head of Rhododendron racemosum, recently figured in our columns, as well as in some of our contemporaries, we are told that the plant exhibited does not agree with Franchet's description, nor with the specimen in the Kew herbarium.

Meeting of the Brussels Orchidéenne on March 12.—First-class Diplomas of Honour (distinctions reserved for novelties) were awarded for:—Lycaste Skinneri var. purpurea (*à l'unanimité et par acclamation*), to M. Pourbaix; flowers very large, sepals pale rose, petals brilliant purplish-rose, lip cream-white, faintly spotted with dark red on the edges of the lateral lobes. M. Du Trieu de Terdonck showed a cut flower of the same variety, but even larger than the former specimen; the same award was made. Cypripedium × Spicerio-villosum, to M. A. Bleu, with four well-coloured flowers, the dorsal sepal analogous with that of Leeanum, but shaded with brighter red for half its height, and relieved with a purplish-red stripe along the midrib. C. × Lathamianum inversum, to M. Linden, of very fine form, and great size. Mormodes Rolfeanum var. nigrum, to M. Linden; a well-named variety, owing to its unusually dark colouring. A Botanical Certificate was also awarded to M. Linden for Nanodes Mantini and Oncidium inops. A First-class Certificate for Scientific Merit was awarded (*par acclamation*) for a collection of eighteen varieties cut bloooms of Vanda tricolor shown by M. A. de la Devansaye. First-class Certificates of Merit were allotted for the following:—Odontoglossum crispum × sceptrum to M. le Comte de Bousies (*à l'unanimité et par acclamation*); flower very large, well rounded, divisions broad, greenish-white, much marked with brownish-red spots. A hybrid Odontoglossum from the same orchidist attained an equal distinction, the form that of crispum; it was specially noticeable for the rich colouring of the markings. O. Rossi var., to M. A. Van Imshoot, with unusually dark sepals; O. stellatum, to M. Linden, two fine spikes of beautiful flowers; O. crispum, to M. le Dr. Capart and to M. Van Wambeke; and for Dendrobium nobile nobilius to M. Linden, a very handsome variety. First-class Cultural Certificates were awarded to M. Van Wambeke (*à l'unanimité et par acclamation*), for four Lycaste Skinneri, large specimens, very well bloomed, and for Odontoglossum Pescatorei, a pretty plant with three fine spikes of bloom and one in bud. *Ch. de B.*

Bournemouth and District Gardeners' Mutual Improvement Association.—At the last meeting of the above on Wednesday, March 15, Mr. John Carruthers, F.L.S., of Downton College, lectured on "Some Diseases of Plants." The chair was occupied by the President of the Association, — Hitchcock, Esq., M.D., J.P. The lecturer said that the disorders to which plants were subject might conveniently be classed under three heads, namely, (1), Those caused by unsuitable conditions, such as too much moisture, cold winds, frosts, and the like; (2), Those due to the attacks of animal parasites; and (3), Those resulting from the action of vegetable parasites—fungoid diseases. He proposed on the present occasion to confine his remarks to the latter important class of disorders. Mr. Carruthers proceeded to give a description of several typical parasitic fungi—such, for instance, as the Potato disease (Phytophthora infestans), Wheat rust (Uredo-rubigo-vera and Puccinia rubigo-vera), ergot of Rye (Claviceps purpurea), &c., and indicated methods of prevention and cure. At the conclusion of the lecture many questions were asked, all of which were very ably and fully answerd by Mr. Carruthers, who in addition to a thorough knowledge of his subject, possesses the by no means common faculty of rendering a somewhat technical subject interesting and easily understood. A hearty vote of thanks, proposed by Mr. C. W. H. Greaves and seconded by Mr. Skinner, was unanimously accorded the lecturer by an audience of about seventy. Votes of thanks were awarded to Mr. J. Spong (gr. to the Dowager-Countess Cairns) for a magnificent specimen exhibited of Dendrobium nobile, bearing upwards of 500 blooms; and to Mr. Barrett, for a very fine Azalea and a plate of Mushrooms. A vote of thanks to the chair terminated the proceedings. The committee of the Association intend applying to the Technical Education Committee of the County Council for a course of lectures during the coming financial year, and they venture to hope that, in view of the interest manifested by large audiences during the last session, the Council will see their way to arrange a longer course next year.

Technical Education in Cambridgeshire.—Plum culture, as expounded by Mr. Fish, excited almost as much interest as that of the Apple throughout the Burwell district. Early in the month an attentive audience of 120 persons assembled at Burwell under the presidency of Mr. Stephenson (Vice-chairman of the Cambs. County Council), and an audience of 100 at Horningsea, under the presidency of Mr. Saunders of Girton, to hear about the modern methods of growing the most and best Plums in the least time, and on the most limited areas; also how to clothe vacant walls of houses, cottages, outbuildings, hoardings, barns, stables, and warehouse, with luscious Plums. Much additional interest was given to the Horningsea meeting by the exhibition of two fine samples of Apples by the local growers, Messrs. Ansell and Briggs; the former placed before the lecturer two specially fine high-coloured Blenheim Orange Apples, and the latter two fine Wellingtons. The Pear has since been the subject of the lectures, and the lecturer through precept and examples of fine fruits grown by Mr. Arthur Sperling of Lattenbury Hall, St. Ives (Chairman of the Cambs. County Council), through the telling object-lessons of young Pear trees already showing fruit-buds, through being worked on the Quince stock, root-pruning, and by his citations of good local examples of fine Pear trees either in the county or the parish, has more than sustained the interest and attendance of his audiences. Questions of all sorts and in all forms are also freely put, and immediately answered, and gardens and orchards are visited, and the most valuable practical information given on the spot. The result of the latter promises to be fruitful in the renovation of many old trees, and the planting of many acres of young ones. Here is a typical question, put in many forms, the answers to which should prove valuable to the public—"We can grow Pear trees well enough, but we fail to make them fruit freely?" Mr. Fish answers—"Root-pruning, or cut the tap or fangy roots. If top-growth is too strong, lift the roots higher if the trees are not too large, or the roots planted too deep, so as to have buried the collar of the Pear tree in planting, and cut out the small useless wood, and feed the roots through top-dressings of bone-dust, soot, rich compost or loam or well-decomposed farmyard-manure in cases of exhaustion, where the trees have become too weak to bear." At Swaffham Bulbeck, which is fairly typical of other districts, the audiences have advanced by leaps and bounds; thus fifty to seventy, and over 100 at the last lecture, under the efficient presidency of Mr. Manley, the schoolmaster.

KEW NOTES.

Erythronium dens canis vars.—E. dens canis, the Dog's-tooth Violet, is one of the most interesting hardy plants in bloom at Kew. Several very charming varieties are planted together on the rockery, and in various parts of the grounds this species and its forms are approaching full beauty. The species is well known to all who care about hardy plants, but the varieties of it are rarer, although distinct and beautiful. Even when out of bloom, E. dens canis is attractive, the leaves oval, and marked with a brownish colour. The white variety is very pure, and is planted at the foot of the standard Rhododendrons, facing the Palm-house; but a good selection of distinct forms may be chosen, the flowers varying from white to quite a purple shade of colour. Rubens, rose, and Vandyke, similar in colour, but with broader segments, are at present in flower at Kew, but in a few days a number of others will be in perfection. A mass of the many varieties, &c., at Kew, is of the greatest interest, and shows what is lost to gardens by not growing the finer-coloured forms of the species. A peaty soil suits the plant best, and moisture is essential, also some amount of shade, although they will grow and flower satisfactorily in the full sun, if the soil is not dry or too poor. For edging beds filled with other spring flowers, or carpeting the surface of the soil as under standard Rhododendrons, are suitable positions. It is very easy to increase the plants by division.

NURSERY NOTES.

AMARYLLIS AT MESSRS. JAMES VEITCH AND SONS.

The Amaryllis have their champions as well as most other classes of showy flowers, and the annual exhibition of the grand collection which has been brought to such a pitch of perfection by the careful hybridisation pursued at the Royal Exotic Nursery, King's Road, Chelsea, is an event looked forward to by a large number of gardeners and amateurs, many of whom come long distances in order to enjoy this great floral display, and to endeavour to get some new ideas as to the best means of cultivating these gorgeous flowers.

At present the large span-roofed house devoted to the Amaryllis (Hippeastrum) is literally a mass of bloom from end to end, the vivid and varied colours having a most dazzling effect. Year by year the flowers are increased in size, and brought nearer to what is considered excellence in form; but although there is uniformity in these matters, the endless variety of colouring prevents sameness even in such a large quantity as that now in flower at Messrs. Jas. Veitch & Sons, and some select one type and some another, so that the whole come in for their share of favour. Among the most marked improvements are the new brilliant scarlet and crimsons, which are flowering for the first time this year, and five of which received Awards of Merit at the last meeting of the Royal Horticultural Society. Of these, Nimrod is a noble flower of a rich orange-scarlet, and one of the largest and best striped yet seen; Socrates is clear scarlet, with scarcely any eye, and the eight large flowers borne by the single bulb is a marvellous display; Excellent has orange-coloured flowers, tinged with rose, and with a white centre; Eldorado is crimson-scarlet, with a white band and freckling at the base of the segment; and Corinna, a rich dark scarlet, with maroon-crimson centre. It will be seen by this honoured set that the tendency is to favour selfs and brilliant colours, but visitors, and especially ladies, are much pleased with the lighter coloured flowers; Carlina is a fine white flower, delicately veined with purple, especially on the upper halves of the segments; and Perle, a somewhat older kind in the same way, is equally effective; Fovia is of the Johnsonii class, white, with light scarlet veining and tinge to the edges of the petals; Ivanhoe is a great beauty white, with a slight crimson feather in the petal; Paripa, white, with scarlet veining; Idomeneus, a noble flower 9 inches across, white and scarlet, with green eye; and Dorothy, Sidoni, Her Majesty, and Crown Princess of Germany are all superb flowers of the light-coloured section.

Returning to the darker and richer-coloured kinds, the most striking is Meridea, which resembles the brilliant Nimrod, but is slightly larger, the flower being over 9 inches across, and the segments 4½ inches wide. Then comes Hippocrates, an immense scarlet with green eye, and white band half-way down each segment. Tallyrand is a large purple-tinted scarlet; Petrina scarlet, veined crimson, and though duller in colour than some, still very distinct; and Orion, Vandyke, and the Champion are superb, and dazzling in the brilliance of their tints. Of the standard sorts, better known than those we have enumerated, Dr. Masters, bright carmine-scarlet; Star of India, reddish-scarlet, with broad white stripe; Fairy Queen, white, striped with scarlet, and Meteor, white, striped with crimson, are good, and will be so regarded for years to come.

But not alone in the production of novelty and excellence in the flowers of the Hippeastrum have the efforts of Messrs. Jas. Veitch & Son been exerted, but throughout the whole of their operation the attaining of a good sound constitution in the bulbs, and of a firm and sound texture in the flowers, have been considered of equal importance, as the free-growing bulbs can be grown with little trouble, and caused to produce many flowers, which if of stout firm substance last in bloom twice as long as the thin petalled varieties of the older strain, and in their endeavours they have been eminently successful. Among the whole brilliant display, however, we missed Hippeastrum Leopoldii and the improvements on it, the best of which is John Heal, but probably they flower later. Let us hope that these fine crimson Hippeastrums, whose white-tipped flowers are so conspicuous and so attractive, will not be "improved away," but will be rather worked up as a class, for their remarkable and showy flowers give a feature unlike any of the others.

HOME CORRESPONDENCE.

HIMALAYAN RHODODENDRONS IN FLOWER.—The following species are now in bloom here in the open air:—Rhododendron eximium (Nuttall), R. cinnamomeum, R. campanulatum, and R. altaclarense. Of these the most interesting is the first, which I find is considered at Kew to be a variety of R. Falconeri. I have both forms, but have never flowered the type, which differs from R. eximium in having the whorls of leaves much more closely set, and the leaves longer and more decumbent. Those of R. eximium are, when young, and till the end of the summer, covered with red tomentum, on the upper as well as the under-side. But the most striking difference (though not the most important from a botanical point of view) is the colour of the flower, which in my specimen is a beautiful pale rose. The colour of R. Falconeri, as was stated in vol. xii., 1892, pp. 19, 74, 136, 190, is dead white or pale primrose, with a dark blotch, of which there is no trace in mine. Mr. C. Noble (xii., 1892, p. 190) suggests that a specimen with lilac flowers may have been R. Hodgsoni. I have this species, which has once produced a truss of deep rose flowers, but it cannot be mistaken for R. Falconeri, as its immense leaves are but thinly coated with tomentum below, and are smooth above, and not rugged, as in R. Falconeri and R. eximium. The flower-buds in the last-named were very large, as described by Nuttall (as "large as small Apples"), and covered with bright buff tomentum. I have to thank Mr. J. G. Baker, F.R.S., for his kindness in looking up the description and synonymy of R. eximium. *A. O. Walker, Nant-y-Glyn.*

CHRYSANTHEMUM VARIATIONS.—We have had a very extraordinary development of flowers on a plant of Chrysanthemum Fair Maid of Guernsey, which has produced two distinct crops of bloom, one at the usual time, November, 1892, another one at the present time. It has sixty blooms and undeveloped buds, and one dozen medium-sized blooms were cut from it ten days ago. It was shortened back about 12 inches after it had flowered, and the miniature buds were showing all over the plant. In all my experience I have never seen anything like it; in fact, I have never seen a Chrysanthemum in bloom in March from the undeveloped buds on the side shoots. I see no reason why it should not continue to produce useful flowers for cutting until April. If any of your correspondents have had a similar experience of this peculiarity, I trust they will communicate through the *Gardeners' Chronicle*. *W. Cragg, nurseryman, Carkickle Gardens, Whitehaven, Cumberland.*

SQUIRRELS.—I am sorry to see that your old and valued correspondent, Mr. J. G. Webster, repeats (p. 325) what I believe to be the slanderous accusation against the prettiest of all our wild animals, the squirrel, viz., that it gnaws and peels the leaders of our coniferous trees. No doubt Mr. Webster knows far more of forestry than I do, but I should like to ask him if he ever personally saw a squirrel engaged on the leader of a Conifer, and then satisfied himself by actual observation at the time that damage had been freshly done to it. Let me say a word on the other side. My garden and adjoining plantation of 3 acres, contain a considerable number of Conifers of various kinds. They also contain, I should think, a number of squirrels not much inferior to that of the Conifers. Anyhow, I do not hesitate to say that if each squirrel destroyed one leader each year, I should not have a decent-looking specimen in the grounds. Whereas the fact is, that it takes a careful search to find one with a defective leader, and we all know that other causes than squirrels at times cause Conifers to go wrong at that point. Further, if they attack the leader, why do not they attack the much more accessible leading-shoot of the laterals? yet I have never heard of their being accused of this. No! Rob me of my nuts they do, and much too freely, but I firmly believe the other crime is a pure invention of the gamekeeper, who is always glad of an excuse to blow the life out of some poor beast. I fear that Mr. Webster, like many other good men, has accepted an evil tradition without satisfying himself of its truth. *A. O. Walker.*

NARCISSUS IN THE ISLES OF SCILLY.—Those who wish to see Narcissus in bloom in masses should visit the Isles of Scilly and its flower farms, where they may see scores of acres of Narcissus, especially Scilly White (Tazetta variety) in bloom. The season has been unprecedented for early blooming, cutting commenced (outdoors) the week before Christmas, and has continued up to the present time. For the last three or four weeks the quantity sent off weekly has been about 50 tons. The quality, as well as the quantity, of the flowers has exceeded that of previous years, and although prices, on the whole, have not ruled high, they have been remunerative. The quantity of land under Narcissus cultivation is between 200 and 300 acres, and great additions are made yearly. The main industry of Scilly at the present time is flower-farming, which would prove a source of great wealth could we but keep the French out of the market. The quality of bulbs for the next planting season is very promising, and already large purchases have been made for the American markets. *J. C. Tonkin.*

REMEDY AGAINST CRICKETS.—Too often, gardeners have to lament the destruction of seedling plants, &c., by insects, but anyone who may be troubled with crickets in fruit and plant-houses will find the following receipt a safe and easy way of quickly getting rid of these devouring insects. If several small marmalade jars are stood on the stages or beds in the houses, and a large table-spoonful of treacle be poured into the jar, with sufficient warm water to make the syrup of the thickness of thin cream, it will be found that the crickets enter the jars, and the liquid being sticky, they cannot escape. I recently caught over one hundred in one night by this means, and I believe I have now cleared the houses of crickets, beetles, &c. This plan is much safer thn he use of phosphorus paste. The jars need not be moved in the day-time, but it is a good plan to take the dead crickets away every morning. *John Chinnery.*

FORSYTHIAS IN BATTERSEA PARK.—The Forsythias are very beautiful in this park in the early spring. F. suspensa is the species planted, and the shoots are not pruned. When pruned the gracefulness of the shrub is destroyed. Large specimens smothered with the golden yellow flowers give colour to the park, and those responsible for the newer open spaces should take note of such hardy, easily grown, and showy shrubs, which fortunately are not averse to London smoke. From now onwards this well-planted park is of much interest, bulbous plants, and hardy flowers of many kinds being used to advantage in the arrangements. Still more will be done in the future by the superintendent, Mr. Coppin, who believes in less formal planting than was the fashion not many years ago. We should like to see in all the London parks greater interest shown in good hardy flowering shrubs. *V.*

BROCCOLI AND THE FROST.—I have never seen the Broccoli cut down by frost so badly as in the present season. Out of about a thousand plants, we have only a couple of dozen left. All varieties suffered about the same. I attribute the fact to sudden severe frost and absence of snow. I did not sow so soon as usual by a month last year; therefore the plants were quite sturdy and strong, and up to a week before the frost we had been cutting Autumn Giant and Osborne's Winter White. While the frost lasted, the mercury was down lower day and night together than it had been for many years. It seems strange that the Savoys suffered not nearly so severely, neither the Chou de Burghley, which is always considered more delicate; while Cabbage suffered to the extent of 90 per cent. Fortunately, we have plenty of Brussels Sprouts, which were uninjured, as also were Asparagus, Kale, and the Borecoles. *W. A. C., Wilts.*

RHODODENDRON NOBLEANUM.—It is to me surprising that this Rhododendron is not more extensively grown than is the case at present. Very seldom do I notice it in gardens. As a rule, it commences to flower in November, and lasts until the others begin

to bloom. Of course, the flowers are not so abundant after March, although a good many can be found even then. We have dozens of large bushes scattered about the grounds here, ranging from 6 to 10 feet in height, and as much in diameter. All through February these were brilliant masses of scarlet, a colour unusual at such a dull period of the year. *R. Weller, Glenstal Castle Gardens, Limerick.*

PETROLEUM AS AN INSECTICIDE.—Relative to the paragraphs which have appeared in the *Gardeners' Chronicle* on petroleum and its effect on plants, it is singular, considering the time it has been in use, to see so much damage still being done by it. From what can be gathered from the correspondence, the opinion held is that it is dangerous to employ in its crude form as a wash generally, or as a winter dressing for Vine rods. It may, however, be used with effect, and with perfect safety in the form of spray, at the rate of a wineglass, with the usual quantity of soap to the gallon of water, on all but the most tender-leaved plants, or those with soft woolly foliage, provided the solution is kept in commotion while being applied. For cleaning Peach trees the solution is invaluable. If "C. W. C.," who in a recent issue asked the opinion of correspondents on this point, would syringe his trees thoroughly with the solution before the buds begin to swell, and again, after the fruit is gathered, he should have little trouble with red-spider or aphides. If we accept the statement of "W. R." p. 78, as to the existence of red-spider being but another name for bad cultivation, most of us will have to bow our heads in despair, until we have found out the secret that no doubt keeps everything in its proper place at Streatham Hill. "W. R." alludes to the various circumstances for its being such, as dry borders, want of nourishment, leaves near the glass, &c., leading one almost to believe in the possibility of spontaneous generation. We are fully alive to the fact that the conditions named are favourable to the increase of the pest, and we also know that many things beyond the gardeners control, such as peculiarity of season, locality, &c., tend to increase the evil complained of; but how to effect a complete annihilation, would be knowledge gained of great value, and for which we would be extremely obliged. Regarding the spots on Muscat Grapes, mentioned in a previous letter, as being the effects of red spider, I expected to see the opinion fully corroborated, besides the interjection by the editor, because there are not a few similarly affected —notably, an old Champion Muscat Grape exhibitor from the south of Scotland, whose Grapes have of late been badly spotted. The marks caused by thrips are quite distinct from those already described, being irregular silvery streaks and spots, and confined to no particular part of the berry. *Wm. Williamson.*

TO DESTROY WEEDS ON LAWNS.—I have often seen the question asked in your columns, as to the best means for the destruction of the various kinds of weeds which so disfigure mown lawns, but, as yet, I have never seen any plan proposed that is at all comparable with one which has been successfully tried here, and in neighbouring gardens, for several years past. The appliances are inexpensive, and the *modus operandi* so simple, that a child can do the work. Take an old champagne-bottle for choice, and tie a cord round its neck, to which cord a piece of wood may be looped as a handle, then procure a ¼-inch iron spike, pointed at both ends. Let the spike be about 18 inches long, and drive a wooden handle on to it at one end. Two long lines for marking the portions of grass operated upon, will be also found useful, and then the machinery is complete. Now fill the bottle with some unrectified sulphuric acid, the brown vitriol of commerce, and dipping the spike in the acid, pierce the heart or centre of each Daisy, Dandelion, Plantain, or other noxious weed, which may be disfiguring the grass between the two marked lines. As a rule, one stab will be sufficient for the destruction of each plant, but if, on inspection, in a day or two, this should not be the case, in every instance, a second dose will make death certain. When the weeds are all killed, bare places will be left on the lawn, but such bare spots will gradually become re-covered with grass in course of time, especially if they be treated with some fresh soil, and seeds be sown thereon. No lawn is ever so much overgrown with weeds as not to be restored to perfect condition if the above instructions be carefully carried out. *O. O. Wrigley.*

COFFEE CULTIVATION IN NATAL.—May I be permitted to say a few words on the above subject? Your informant seems to infer that the chief reason of the failure of Coffee in Natal is due to the want of skill and enterprise on the part of the planter. Now, if thousands could be made out of Coffee twenty years ago (and I know full well that such was the case), there could not have been a great deal wrong in the way the grower went about his work, and a man must be sadly in want of common sense to alter his methods of cultivation to such an extent as to cause the present lamentable state of affairs in Coffee production. I am rather surprised that a government official from Natal, if he has visited any of the Coffee-growing districts in the colony, should make such a statement. Without a doubt the real reason of the failure is the same as that which has been nearly the ruin of some of the planters in Ceylon, i.e., leaf disease, known to scientists as Hemileia vastatrix. This first made an appearance in the Natal plantations about fifteen years ago, and from that time the cultivation of Coffee has so fallen away that now it forms a very small item in South African industries. Many efforts have been made to eradicate this destructive fungus, but in vain, and the planter thinks himself very fortunate if he can prevent it spreading. Mr. Medley Wood, of the Botanic Gardens, Durban, told me in a conversation I had with him on the subject, that it was possible to cope with it by supplying the infected plants with plenty of nourishment in the form of manure, but it would be labour in vain to attempt to destroy it. Some of the pioneers of the Coffee industry in Natal told the same tale, hence their reason for rooting up the plants, and putting the land under tea and sugar; and who can blame them for growing the latter at a very fair profit, instead of Coffee at a loss? Much might be said with regard to the successful and unsuccessful cultivation of many fruits that would be welcomed to the English market, but it certainly ought not to be laid entirely at the doors of the Natalian that the Colony produces less Coffee than it did twenty years ago. *G. W. Staden, Kew Green; late of "Nonoti Peak," Natal.*

HOLLY GROWING THROUGH AN OAK.—Not far from the historic house, Moyles Court, near here, stands a very old Oak, which must have been a fine tree in its prime maturity. It is decaying, but still puts forth a few living branches. Its bole measures nearly 30 feet in circumference, and is partially hollow. From the crown of its bole, 14 feet from the ground, springs a large luxuriant two-forked Holly tree. Its larger bole is 3 feet in circumference, and ascends some 20 feet. Thus we have the certainly uncommon and, I believe, unique sight of a Holly rising above a massive Oak, roughly like a steeple surmounting a tower. Down through the hollow bole of the Oak the roots of the Holly can be seen descending like a score or more of stout cables, varying in sizes, the largest as big as a man's wrist. Rootlets also branch out into the decaying wood, and apparently feed upon it. It is not unusual to see a dwarf stunted Holly growing in the cleft of another tree, but the present case has inexplicable circumstances for me. The initial rooting and growth is easy to understand, but how did these long cable-like roots gradually work their way down through the bole of the Oak? They must have fed on the decaying wood of the Oak as they went; then they had to eat their way through the roots of the stump also. I could not understand where the nourishment was derived to support such a luxuriant tree. The Holly roots would have to compete with the roots of the Oak, which must have long before exhausted the soil around. The Holly must have largely lived on the decaying Oak-wood. Is not this unusual? *Arthur H. Kingsbury, Ringwood, Hants.* [*Communicated by the Director, Royal Gardens, Kew.*]

SINGLE CHRYSANTHEMUMS.—Mr. W. Wells, Earlswood, who grows an enormous number of Chrysanthemums, is of opinion that whilst single varieties get very little appreciation from schedule makers, they are by far the most popular with ladies, who will often go into ecstasies over quaint flowers, from which the stiff and starched florist, who has no soul above "big 'uns" and prizes, would turn from with contempt. Happily for the ladies, therefore, these singles are very easily induced to seed, and raised in that way. There are thousands of such being tested the second year from cuttings at Earlswood. Of course, there are plenty of doubles also, indeed, all the best new and old obtainable. One marvels how customers for the myriads of plants one sees in houses and frames are found, but they are found, and, too, in all parts of the world. However, the pleasing way in which the elegant single forms cater for feminine taste is one of not the least recommendations of the Chrysanthemum. *A. D.*

WINTER TOMATOS.—I was but the other day in a place where Tomatos are grown in the summer literally by the ton, and the fruits find a ready sale. None the less, there was no effort made to grow plants during the winter, when home-raised fruits of good quality would sell easily at treble the best price obtained in the summer. I refer to this, because sometimes Tomatos are recommended as winter varieties, yet somehow we never see them in the winter. There has been no Tomatos seen at any of the Royal Horticultural Society's meetings for the past four months. When the merest tyro can grow Tomatos easily in the summer, is it not possible for able growers to get them in the winter in decent form and abundance? If not, then assumed winter-fruiting Tomatos are non-existent. Here is a fine field open to the enterprising hybridist or grower who wishes to make a fortune. *D.*

GOLD FISH.—The remarks in the *Gardeners' Chronicle* concerning gold fish drew my attention to the subject. We have them here in an aquarium which is 14 feet long by 7 feet broad, and 2 feet deep. I may add on the information of those who know, that these fishes have only been fed once during the last eighteen months! the tank is filled once a week. *J. A. Rogers, Melchet Court.*

ROUND *versus* PRICKLY SPINACH.—It has long been a standing article in the horticultural creed that, whilst round Spinach only was suited for summer purposes, only prickly Spinach was fitted for winter work. I must confess to have this latter notion most severely tried when going through the kitchen gardens at Claremont, Esher, the other day, and observed the singularly marked strength of leafage and beautiful robustness of one breadth of Spinach over another breadth growing side by side. I enquired of Mr. Burrell whether the former was the Victoria or Viroflay, but he said no, it was simply round Spinach, and the poor breadth almost leafless was prickly Spinach. The former was relatively 50 per cent. better than the latter. Is that other gardeners' experience? If Mr. Burrell's experience be others, then have we been blundering greatly over these divers forms of Spinach! *A. D.*

SPECIES OF ASH.—In your number of March 11, no mention is made of a variety of Fraxinus elatior, which is far more beautiful than either the Parsley-leaved or the tufted form. This is Fraxinus heterophylla (Vahl.), a variety with simple lanceolate leaves of about 8 inches in length and 2 inches in width. These give the tree an appearance not unlike that of Eucalyptus globulus. The tree is not common, I have only seen it at Hartland Abbey in N. Devon, and at St. Columb Rectory in Cornwall. It seeds freely, and I believe that it comes true from seed. It would be interesting to know more of the distribution of this variety of the common Ash in Great Britain. *G. H. Wollaston, Clifton.*

ISOPYRUM THALICTROIDES.—A very pretty and hardy plant to ornament the rockery in early spring is the above-named. It grows only 3 or 4 inches high, has most elegant light Rue-like foliage, and small flowers of pure white. It was in flower this year before the end of February, and is now passing off, but the leaves continue, and are never untidy. The only objection to it is its running habit, but it roots so lightly that it does not smother anything amongst which it grows. I lost my temper with it two years ago, because I saw it overshadowing some choice Androsaces, and ordered it to be cleared entirely out; but I am glad to say that it has quite recovered this rude treatment, and is a very welcome ornament so early in the year. It is a native of the South of France, and the same zone of latitude across Europe, re-appearing in the Himalayas. I have not often seen it in nurserymen's catalogues, and its slight thread-like stolons make it not very easy to deal with, until well-established. I found it abundantly wild last year in woods near Bayonne; growing close to the edge of streams, and flowering at the beginning of March. *C. Wolley Dod, Edge Hall, Malpas.*

LACHENALIA AUREA GIGANTEA.—The plant which you mention as Lachenalia aurea gigantea, received from Mr. Todd, is no doubt the same plant as one of which I sent the flower two years ago to Kew, and which Mr. Baker called a large form of L. aurea. I received mine amongst imported bulbs

from Mr. O'Brien. In habit the plant is widely different from L. aurea, but is undistinguishable (except from its larger flowers) from L. Nelsoni, which I understand to be a garden hybrid between L. aurea and L. luteola, and which in habit closely resembles L. luteola. These three, luteola, Nelsoni, and the imported one, have ascending strap-shaped shining green leaves, whereas L. aurea has broad short recumbent dull green leaves, and is not yet in flower, and will not be so until the other three are quite out of flower. Can it be a natural hybrid between aurea and luteola? If I were to name it I should call it L. Nelsoni gigantea, which would exactly describe it, which the other name does not do. *C. W. Strickland.*

THE ROYAL HORTICULTURAL MEETINGS.—At the commencement of your report of the Drill Hall meeting of the 14th, it is stated that "exhibits were so numerous, it was with difficulty they were accommodated." That was perfectly true, but at least the fault did not lie with the society, for there was still ample room and spare tabling if needed. I took the trouble to inquire as to the prevailing practice in relation to the sending of exhibits to these meetings, and learnt that only two or three of the almost regular exhibitors give the superintendent any notice, and that the majority give no notice whatever. Now, if postcards reached the Drill Hall early in the morning of the meeting, there would be ample time, I take it, to make the needful preparation, for a line of tabling can soon be run up; but if no notice of any sort is given, then no wonder if late comers find their products placed disadvantageously. Surely, it should not be too much trouble to give notice the day previous to the meeting on a postcard. That would allow some time for making provision, especially in granting more space, for at least half as much tabling again as was finally placed could have been advantageously filled with the numerous exhibits. Now that the meetings are really becoming shows, and some of them very beautiful ones, it cannot be too much to expect of exhibitors that they give some previous notice of their intention to exhibit, and probable space needed, so that ample room may be found, and the beauty of the exhibition be much enhanced. It seems as if these shows would become larger every meeting. *A Fellow.*

LÆLIA VITELLINA, *new gard. hyb.*

At fig. 53, will be found an illustration of an interesting hybrid Lælia, raised in the gardens of Baron Schroder at The Dell, Egham, but whose

Fig. 53.—LÆLIA × VITELLINA: FLOWERS ORANGE-SALMON COLOURED.

parentage, not having been recorded, can only be guessed at. The supposition is, that L. harpophylla was one of the agents in its production, and the probability is that L. Perrinii was the other, and most likely the seed-bearer. As evidence of that, we have in L. × vitellina an indication of the deflected apex of the labellum as seen in L. Perrinii, and the influence of the orange-coloured species, which has been proved by these garden hybrids to be so potent in suppressing other colours in the species in which they are crossed, seems to have failed to wholly obliterate the dark

purplish-crimson on the tip of the labellum of the other supposed parent. I have not yet had an opportunity of examining the pollinia of the new hybrid, and therefore cannot say how they stand with relation to true Lælia.

The flowers of this beautiful novelty are orange-tinted, Indian-yellow the base of the column, and tip of the labellum tinged with light purple. The plant was awarded a First-class Certificate at the Royal Horticultural Society, March 14. *James O'Brien.*

THE ROSERY.

PRUNING ROSES.

Now that the time is coming on, a word or two may not be out of place. On the pruning of standards little can be said; it is principally concerning dwarf and pot Roses that I would make a few remarks. Some time ago, we had some Rose beds planted with dwarf bush Roses, which looked miserably bad, and upon examining them, I found that they had been pruned back too severely; and instead of pruning them (they did not need much) I gave them a heavy top-dressing of manure, and occasionally during the summer a syringing with the garden-engine, and the growth these bushes made was simply wonderful, some of them making shoots 10 feet long. The following season, instead of cutting them back, I had some wire-pegs made, and pegged them down all over the beds, and the quantity of bloom produced was marvellous. I have seen many bush Roses killed by too much pruning. In this same way, I would recommend pot Roses to be treated, excepting such as are being grown for exhibition. In the previous autumn or winter, let all well-ripened long shoots be tied round four or five stakes stuck in round the edging of the pots, and the result will be a greatly increased number of flowers. After the plants have flowered, let them grow away again without stopping, and in this way the wood will get thoroughly ripened. Of course, I know all Roses cannot be done in this way, simply because they do not make a sufficiently vigorous growth; but even with these weaklings, one or two slight dressings during the growing season of Standen's manure works wonders. *Rusticus, Wilts.*

Tea Roses.

The writer has often been amused at the various articles which appear from time to time in your valuable paper reflecting on the hardiness of Tea Roses, and as "Wild Rose," in your issue of the 25th ult., is apparently still convinced of their tenderness, I should much like, with your permission, to give a few reasons for an altogether opposite opinion. In this district (eastern Scotland) I have grown Teas entirely unprotected for sixteen years now—comparatively few for the first few years, but latterly possibly the largest collection in Scotland. At present they are grown by the acre. In some winters during that period I have seen the dormant buds embedded in ice for six weeks at a stretch; and that year we had 500 dormant Maréchal Niel, and only lost two buds, and they grew from 5 to 7 feet high the next summer.

We consider this winter as trying possibly as any that we have yet encountered, and that chiefly owing to the very cold season of 1892, which here (at Broughty Ferry) was the coldest we have had for twenty years, the average winter temperature being 46°.6, while 1892 only registered 44°.6. The hardest frost we have had during the winter of 1892-93 was 22°, and still we protect none whatever, and up to the present time no harm has been done; and I have no doubt whatever but that the Teas will be found when summer comes as solid as of yore.

As between Teas and Hybrid Perpetuals we find absolutely no difference in regard to hardiness, though the Hybrid Perpetuals make more show of growth than the weaker growing Teas, and the latter are sometimes harder cut down in their late-made shoots; still, root for root, the one is as hardy as the other, and on the seedling Briar (the best of Rose stocks) succeed in a wonderful manner.

There is also, I think, a great deal of harm done by late pruning. I confess to being much more afraid of the late pruning with its sometimes serious bleeding of the wounds draining slowly the life-blood of the Rose, than ever I was of frost. The rule here is to commence pruning at the new year, finishing by March 1. During this period on mild days the pruner is at work; and this season, although it is not quite finished owing to frost and snow, we are nearly so. *James Simpson, Dalhousie Nursery, Broughty Ferry.*

Roses Madame Desprez and Jaune Desprez.

These are two old varieties, the former belonging to the Bourbons, and the latter to the Teas. Madame Desprez was raised by M. Desprez very many years ago, and is a strong grower, well adapted to form an arbour or cover a wall. The blooms are large, double, produced in massive corymbs; colour rosy-lilac shaded violet. It is a Rose whose display is magnificent whilst it lasts; but of short duration—less than a month. On its own roots it is long-lived, throwing up strong suckers and basal shoots. Only moderate pruning is necessary. The foliage is massive, robust, and enduring.

Jaune Desprez is one of the sweetest of Tea Roses, of a yellowish coppery tint, by no means a strong or rapid grower, but exceedingly floriferous. I well remember a plant of it at Highnam Court, Gloucester, artfully planted against a south wall, and close by a door in the kitchen garden. The perfume always seemed to meet one on the instant when the door was opened. It is not mentioned under its name in the *Dictionnaire des Roses,* but the description there found of Jaune Ancienne fits it very well. *A. Y. E.*

VEGETABLES.

BROCCOLI—SUTTON'S LATE QUEEN.

As the time for sowing seeds of Broccoli is approaching, I would draw the attention of your readers to the merits of Sutton's Late Queen Broccoli. During the present and two preceding winters, this variety has withstood frost without any protection whatever, whilst other Broccolis have been destroyed, even although heeled-in in October, or bulwarks of soil heaped around their necks and roots. Last summer and autumn being sunless and moist, the plants made strong soft growth; but in spite of this and the severe frosts which followed, Late Queen looks as promising as it ever did. Living as I do in a cold district, and having a heavy soil to deal with, it is found requisite to sow the seeds of Broccoli on the first favourable opportunity after the first week in February, in order that they may have an early start and a long season of growth. The quarters where they will be planted out are well-manured, trenched, and ridged in the autumn. Late Queen, when well-grown, produces large beautifully-white heads, and is undoubtedly the best of its season—May and June. I have tried to increase the frost-resisting power of these plants by starving the land, and have reaped only miserably small heads, tough in texture, but I have now given up the practice in favour of one more in keeping with the requirements of this crop. *J. Riddell, Castle Howard.*

Finnochio, or Fennel.

In a recent issue of the *Gardeners' Chronicle,* mention is made of the use and cultivation of "Tuberous Fennel." This vegetable is highly appreciated in Southern Italy; however, it is not eaten, as you suppose, boiled, but raw, and it is not wanting during the whole winter-time at any dinner-table. It plays here the same *rôle* as in your country does Celery. [We prefer it cooked like Celeriac.]

We offered last year to the trade a new, large, fine-flavoured variety of Fennel, named Prince Bismarck, which attains the weight of 4 lb. if well cultivated. We are sure that, when Finnochio is better known in northern countries, it will be as much appreciated as Celery. *Herb & Wulle, Naples.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

March 14.—Present: Dr. M. T. Masters, F.R.S., in the chair; Mr. Michael, Mr. Blandford, Dr. Scott, Professor Oliver, Rev. W. Wilks, Professor Farmer, Dr. Müller, F.R.S.; Mr. G. F. Wilson, F.R.S.; Professor Marshall Ward, F.R.S.; and Rev. G. Henslow, Hon. Sec.

Sargasso Weed and Cocoa-nuts.—Mr. Blandford exhibited a specimen collected off the Azores. He also remarked upon a perfectly successful experiment of bringing fresh green Cocoa-nuts from Jamaica in the refrigerator of a vessel.

Tipulæ in Soil.—Dr. Müller exhibited some grubs which were pronounced to be a species of this genus allied to the common T. oleracea, or Daddy Long-legs.

Blue Primulas.—Mr. Wilson exhibited about fifty varieties of different shades of blue, plum-blue, and bluish-violet Primroses, all being seedlings from the original "Scott Wilson," and grown at Weybridge and Wisley.

Knotted Oak Branch.—Dr. Masters exhibited a specimen of a knotted branch, on which a black fungus was present. He had referred it to Dr. Cooke, who had determined the fungus to be Dichæna quercina, a species that feeds on the living bark. It was a question, however, to be solved whether this fungus was the cause of the knob-like protrusions or not. It was referred to Professor H. Marshall Ward for further examination and report.

Cecidomya taxi.—Professor Farmer exhibited specimens of Yew sprays affected by this well-known parasite, which determines an arrest of the axis and causes the leaves to form a rosette. The question was raised as to whether the shoot subsequently elongated or not. In Mr. Henslow's garden both male and female Yews are always affected by it, the tufts of leaves and shoots attacked dying every year.

Injuries to Plants by Certain Substances Present in Coal Smoke.—Prof. Oliver exhibited several results of his experiments in testing the effects of the ingredients of fog and their allied substances upon plants. A frond of Phegopteris trichoides, subjected to the vapour of phenol under a bell-glass, was blackened. White Lilac became of a chocolate-brown colour; white Cyclamens, however, being unaffected, though killed. It was remarkable that the alcoholic extract of chlorophyll made from the blackened frond was identically like that of the uninjured green leaf, showing that the chlorophyll was "masked," but not altered in character by the phenol. The effects of "pyridine" were not so marked, as the Lilac and Cyclamen were only slightly tinted with a pale brown colour. Professor Oliver had tested these and other plants for tannin, but the distribution of this substance in organs which change colour with or resist phenol and other coal-tar products, was found to be such that no positive conclusions could be drawn.

Professor Oliver also showed the effects of sulphurous acid gas, so prevalent in urban fogs. The above-mentioned white flowers were killed by its action. The spectrum of chlorophyll of leaves subjected to its action showed the usual modifications due to the presence of an acid. It is to be noted that the effects produced were only on living protoplasm, no such results occurring if the protoplasm had been previously killed.

Dr. Scott said that he hoped Prof. Oliver would be able to throw some more light on the falling of almost uninjured leaves, which was perhaps the most remarkable of the effects of fog. In these cases, the leaves, when they fall, are alive, and show scarcely any symptons of poisoning. He thought it possible that the investigation of this phenomenon might help to explain the immediate cause of the normal fall of leaves in autumn, as to which we at present know little more than the anatomical conditions.

Prof. H. Marshall Ward, in commenting upon Prof. Oliver's elaborate report, observed that the author had evidently attacked the problem quite in the right way, by experimenting on plants with the separate ingredients of urban fogs; and that as the report showed, the investigation had raised a number of interesting and very important questions in vegetable physiology. It was, indeed, a matter of surprise to see how much information Prof. Oliver had extracted from his investigations in the short time at his disposal. He trusted that the author would persevere with his experiments, as he would have the hearty sympathy of everyone

interested in the subject. Prof. Ward alluded to some old experiments of his own, in which he found that in fine, dry, bright, and sunshiny weather plants resisted the effects of sulphurous acid better than in dull seasons, thus correlating in an interesting manner the results of Prof. Oliver, in that in foggy weather sulphurous acid gas was most effective in injuring plants. The result of this action was a "plasmolysis" and diffusion giving the appearance of sweating in the cells. The sulphurous acid in the gaseous condition penetrated the intercellular spaces of the tissues, and entered the cells in solution.

Dr. Müller called attention to the statement in the report that, according to Dr. Bailey, the organic matter which forms a large proportion of the greasy deposit left by fog, and which proved so injurious to plants, consisted mainly of some form of pyridine. Now, considering that pyridine is a rather volatile liquid substance, this is a somewhat surprising fact, and the question arises how the pyridine and other similar volatile constituents of smoke become thus fixed and precipitated. He suggested that this probably is brought about by the agency of the particles of solid hydro-carbon and tarry ingredients of the fog, which possess great affinity for these volatile substances, and absorb them. It is now well understood that these solid constituents of the smoke, along with the mineral dust suspended in the atmosphere, form the primary cause of the formation of fog.

Dr. Masters exhibited sprays of Holly, Skimmia and Aucuba covered with sooty deposit of fog, but yet the foliage was apparently healthy. He attributed their capability of resisting the deleterious influences to the great thickness of the cuticle possessed by these plants. He observed that evergreens often possessed two or three rows of palisade-cells, instead of one only, and were thus enabled by their structure to offer a greater degree of resistance to injurious vapours than plants less well equipped. Dr. Masters also observed that plants with an aqueous hypodermal layer, such as was present in certain Orchids, might on that account be better able to resist the injurious effects of fogs. Mr. Henslow added that East Indian Rhododendrons have much tannin, a moderately thick cuticle, and aqueous layers on both sides of their leaves, and as they withstood the fogs well, these features might corroborate Dr. Masters' suggestion. Dr. Masters also remarked on the observation of Prof. Oliver that Monocotyledons appeared to be less liable to injury than Dicotyledons. He threw out the suggestion that as so many of the former class have a more or less erect, phyllodineous foliage, the fog deposit would be less likely to accumulate upon it than on the more usually horizontal blades of dicotyledonous plants. In addition to this morphological feature was the anatomical structure—viz., there being two palisade layers and the presence of stomata on both sides, &c. Such and other histological differences, though apparently not borne out in the case of Ferns, might prove to account for some of the differences mentioned.

The thanks of the committee were unanimously tendered to Prof. Oliver for his interesting and valuable report.

ROYAL BOTANIC.

March 22.—This society held its first exhibition of the present year on Wednesday last. The exhibits were not numerous, but the plants shown were varied, interesting, and in fine character, especially Persian Cyclamens.

There were the usual classes for Hyacinths, Tulips, and other spring-flowering bulbs. In the amateur classes for Hyacinths, Tulips, Polyanthus, Narcissus, and Crocuses, Mr. James Douglas, gr. to Mrs. Whitbourne, Great Gearies, Ilford, was 1st in each case, exhibiting the plants well, far better than in the trade division. The two chief prize-winners other than Mr. Douglas, were Mr. H. Eason, gr. to B. Noakes, Esq., Hope Cottage, Highgate; and Mr. R. Scott, gr. to Miss Foster, The Holme, Regent's Park.

In the nurserymen's division for bulbs, the chief prize-winners were Messrs. Williams & Son, Fortis Green, Finchley, but as a rule the flowers were poor. The same firm had the finest pots of Lily of the Valley; Mr. W. Morle being also a successful exhibitor in the trade classes.

Very fine Amaryllis were seen in the class for twelve, equal 1st being Messrs. Paul & Son, Cheshunt, and Mr. Jas. Douglas; whilst the best six specimen Azaleas were those from Mr. R. Scott. Splendidly-flowered Deutzias came from Mr. Douglas, who was placed 1st. Messrs. Paul & Son were 1st for six Roses, the plants well-flowered; whilst Mr. Douglas was the most successful for twelve Freesias.

Amongst the most interesting features was the collection of hardy herbaceous plants, from Mr. T. S. Ware, Tottenham, which won the 1st prize; the compact variety of Spiræa (Astilbe) japonica, named multiflora compacta, was well shown.

Cyclamens were the finest subjects to be seen; we have never seen better plants at any exhibition of the Society. Twelve very fine specimens came from Mr. Mowbray, gr. to Major the Hon. H. C. Legge, Fulmer, Slough, who was 1st in a good competition; Mr. T. Pestridge, Boston Park Road Nursery, Brentford, 2nd.

Miscellaneous collections formed the principal part of the show. A very extensive display of bulbous plants, Cliveias, new Orchids, &c., was made by Messrs. B. S. Williams & Son, Upper Holloway (Large Silver Medal). New Roses and several boxes of cut Camellia blooms were staged by Messrs. Wm. Paul & Son, Waltham Cross (Silver Medal); whilst a similar award was given to Messrs. J. James & Son, Farnham Royal, near Slough, for their splendid group of Cinerarias, the plants very dwarf and compact, and the flowers of exceptionally fine form. Messrs. W. Cutbush & Son, Highgate, exhibited a miscellaneous group, chiefly hard-wooded plants. Messrs. H. Williams & Son, Highgate, Hyacinths, Tulips, and Narcissi; Mr. John Odell, Gould's Green, Hillingdon, Cyclamens; and the St. George's Nursery Co., Hanwell, new Cyclamens, in each case a Silver Medal being given. Messrs. Barr & Son, Covent Garden, were awarded a Bronze Medal for a group of Narcissi and other spring flowers, and Mr. T. Pestridge for his group of Cyclamens.

There were many new plants exhibited, Hippeastrums in particular from Messrs. J. Veitch & Sons; Messrs. B. S. Williams & Sons, having a number of Cypripediums. Several botanical and floricultural Certificates were given. Their number is, however, so great that want of space prevents description.

EDINBURGH BOTANICAL.

March 9.—The fifth meeting was held on the above date, Dr. David Christison (President) in the chair. The Curator exhibited from the Royal Botanic Garden a plant of Rhododendron racemosum, Franch. This is an extremely beautiful dwarf species, growing only a few inches high, and flowering freely. It is a new species, found by the Abbé Delavay, in the province of Yunnan, China; also a plant of Anoiganthus breviflorus in flower; Saxifraga Burseriana Boydii; and a branch of Rhododendron dahuricum var. atrovirens, covered with deep red blossoms.

The Rev. David Landsborough, of Kilmarnock, sent branches of Eucalyptus pauciflora, along with some ripe seeds of the same plant, from a tree growing in the open air at Arran. He also sent branches of Eucalyptus alpina, and a flower-spike of Cordyline australis with young fruit on it, both grown in the open air at the same place.

In the absence of the author, a paper by Mr. Arthur Bennett on the "Discovery of Orobanche cruenta, Bert., near Oban, Argyllshire," was read by the assistant-secretary.

The president read a notice of Mr. Marsham, of Stratton, Norfolk, a country gentleman, who in the middle of last century, appears to have devoted much time to the study of forestry. All records of his observations seem however to have been lost, except those contained in two letters, from which it seems he was in the habit of studying the effect of washing trees with water by means of a brush, and of manuring the soil in the neighbourhood of their roots.

In the discussion which followed, it was suggested that the washing of trees might greatly benefit their health, especially in towns where the bark of the stem becomes covered with a thick deposit of soot and dust, which is dependent for its removal on occasional showers.

The assistant-secretary showed some winter buds and plants of Utricularia vulgaris.

Mr. Lindsay read the monthly report on the temperature and vegetation at the Royal Botanic Garden. During February the thermometer was at or below freezing point on eleven occasions, indicating collectively 64° of frost for the month as against 114° for the corresponding month of last year. The lowest day temperature was 39° on the 24th, and the highest, 58° on the 19th.

A good deal of snow fell during the last week of the month. Rhododendron præcox had all its flowers destroyed by frost on the 25th, while R. dahuricum was quite uninjured, and is flowering more profusely this season than it has for some years. Of the forty spring-flowering plants whose dates of flowering are annually recorded, the following fifteen came into flower: Rhododendron atrovirens on February 4, Tussilago fragrans, Leucoium vernum, February 6; Corylus Avellana, Crocus susianus, February 8; Bulbocodium vernum, Scilla præcox, February 10; Crocus vernus, Scilla sibirica, Rhododendron Nobleanum, Symplocarpus fœtidus, February 14; Tussilago alba, T. nivea, February 18; Daphne Mezereum, February 19; Nordmannia cordifolia, February 20.

FLORISTS' FLOWERS.

NEW DAHLIAS.

It is a somewhat curious circumstance that so few new show Dahlias should have appeared during the last year, while new Cactus, decorative and single varieties have been abundant. The season of 1892 was chiefly remarkable for the valuable additions made to the true Cactus type by Messrs. Keynes, Williams & Co., of Salisbury. A few years ago, when they introduced the pale amber-coloured Panthea and the reddish-salmon Panthea, it was seen they had secured a break in colour that shadowed possibilities of novel colouring undreamed of previously, and these have become verified in the novel and beautiful varieties they have produced this season.

In Delicata was to be seen one of the most beautiful varieties of the true Cactus Dahlia. Mr. T. S. Ware obtained a variety that marked a very decided advance towards new tints in that section, and the fine character in which it was shown justified the awards made to it when first exhibited as a seedling. It is well described as "light salmon at the base of the petals, gradually shading off to a lovely delicate pink."

One of the best of the new show varieties seen last season was Gwendoline, shown by Mr. J. R. Tranter, Henley-on-Thames. It is a good second-row flower, of a bright wine-crimson colour, shaded with maroon, the petals small and well-formed, fine outline and well up in the centre. It missed a Certificate of Merit at the Crystal Palace, but it was awarded one at Reading, Oxford, and the Earl's Court show. Though we have so many dark self-coloured Dahlias, Gwendoline showed distinctness of character.

Mr. G. H. Pierre Harriss showed flowers of Draughtsman, a dull crimson with deeper shading, good petal, and fine shape; Rosy Queen, rose, with slight stripes of dull purple; and Freedom, buff, with a bright rosy reverse to the petals. At Earl's Court, Mr. Tranter had Gwendoline in good form. Mr. Tranter also had a light variety named Florence Tranter, that will probably be seen this season in better form. Messrs. Keynes, Williams & Co., showed Dazzler, Fancy, yellow, striped with crimson; a finely-formed flower of great promise; Virginale, a charming light variety in the way of Queen of the Belgians, but with a deeper colour on the petal edges; and Niobe, deep bright crimson, a well-formed flower, of good quality.

Coming now to the Cactus type, allusion has already been made to Ware's Delicata; and fine and distinct varieties were exhibited by Messrs. Keynes & Co., viz, Bertha Mawley, very bright orange-crimson, slightly shaded, a true Cactus type, a new shade of colour. An Award of Merit was also given to this variety by the Royal Horticultural Society. Other of their varieties were Countess of Gosford, yellow ground, suffused with bright salmon, and slightly tinted with pink; and Countess of Radnor, yellow ground, rich salmon, suffused with mauve and pink, fine in colour, very distinct and striking—certificated by the Royal Horticultural Society. Kaiserin, of a pale yellow shade of colour, and of true Cactus form; Mrs. Basham, yellow, flushed with deep mauve and salmon, novel and distinct; Miss Violet Morgan, yellow, edged with pinkish-salmon, very pretty; Avalanche, a white decorative

variety, with curiously-formed petals, which acquire a kind of tubular form with age; Countess of Pembroke, decorative, soft pinkish-lilac, very distinct in colour; and Daphne, deep pink, flushed with rose.

At the Crystal Palace, Mr. Geo. Humphries, nurseryman, received Certificates of Merit for May Pictor, a pale-yellow variety of the true Cactus type. Messrs. Perkins & Son, nurserymen, Coventry, showed at Reading Cactus Dahlia Matchless, crimson, shaded with maroon of the true Cactus type; and a valuable addition to the dark varieties.

At the Crystal Palace and elsewhere, Mr. C. Turner, Royal Nursery, Slough, staged several new varieties of the Cactus type, among them Sir Hugo, Oscar, Bullion, Lord Rosebery, Lady Primrose, H. E. Milner, Blushing Bride, and Homer; Certificates were awarded to H. E. Milner, salmon and mauve, very distinct; and Blushing Bride, very delicate blush-white, a charming variety; Sir Roger, bright pale orange-scarlet; and Robert Cannell, magenta, tipped with violet; both of the true Cactus character, are beautiful varieties. New Pompon varieties were plentiful last year, and mention should be made of Bacchus, very bright orange-scarlet, small and of the finest quality (Keynes & Co.); Amber, amber and gold, like the colour of the old Dahlia Leah (C. Turner); Gipsy Queen, dark maroon, small and of fine shape; an improved Little Nigger (C. Turner); and Eva, bright red centre, the edge of the petals paling to delicate lilac, very pretty (J. T. West); Hilda, a pretty tipped variety (C. Turner); W. Tommy Keith, white, with side margins of red, very pretty, and compact; Winnifred, blush-white, small, and of very fine shape (J. T. West); Boule d'Or, bright yellow, a small well-formed flower; Amber and Gipsy Queen (C. Turner); Madge, red-tipped white, fine shape; Little Frank, yellow, flushed with pale salmon; Bacchus and Ceres, delicate primrose, extra fine, all from Messrs. Keynes & Co.

Single varieties certificated at the Crystal Palace were:—Duke of York, very bright deep orange-scarlet, from Messrs. J. Cheal & Son; Yellow Satin, deep satiny-yellow—fine shape; Sunningdale Scarlet, rich deep scarlet—fine shape; and Kitty, the petals tinted with bright pale pink—fine shape and very distinct; Jack, yellow-satin; and Cadet, all from Mr. T. W. Girdlestone, Sunningdale. *R. D.*

Fruit Register.

APPLE ROYAL SOMERSET.

In this we have a fine cooking kind. It is large and handsome, round, and very yellow, and the flesh is white. It secures the cook's favour, because it is nice and white when sent to table. In our orchard the trees grow well; they are hardy, and most years bear an average crop. It is grown largely in the West of England, which may account for the name. It keeps well with us into March, and we have some nice samples in our fruit-room, and they look as if they would be as good three months hence. *East Somerset.*

Apple Beauty of Stoke.

Mr. Doe, of Rufford Abbey, sent me a few of the above a few days ago. It is a large handsome fruit, and a reputed good keeper, remaining quite sound without speck or blemish till the present season. The cooking qualities are all that could be wished for, the pulp of good flavour, and nice colour when cooked. It is a fruit that will doubtless be sought after when its merits become known. It bears freely on quite small trees, which at this time Mr. Doe tells me are covered with fruit buds. [Why not show some fruits at the next meeting of the Royal Horticultural Society? Ed.] *A. Henderson, Thoresby.*

—— This new Apple, raised by Mr. Robert Doe, gardener to Lord Saville, Rufford Abbey, is, think, likely to be much sought after as an early culinary variety. When at Rufford two months ago, I was shown bushels of splendid fruits, which were even in size and very firm, and of a rich golden colour, many of them weighing 9 and 10 ounces apiece. The fruit when cooked is everything that one could desire, and as an Apple for the dessert it is not to be despised; juicy, and the flavour is rather brisk. I was informed that a tree of Beauty of Stoke comes quickly into bearing, indeed, the crop which was shown to me in the fruit-room came chiefly from young standards. The growth is vigorous without being gross, and the tree produces plenty of bearing wood. I understand the stock is in the hands of Messrs. Veitch & Sons, Chelsea. *Geo. Dyke, Kirklington Hall, Notts.*

Cockle's Pippin.

As a late-keeping dessert Apple, this variety (I am now eating fruit of it), which was alluded to in very favourable terms recently in the *Gardeners' Chronicle*, is excellent at even this late part of the season, the fruit being plump, juicy, pleasantly acid, and sugary. In my grounds at Bedfont, it crops very well. It is generally known as Cockle Pippin, and it is well to state that according to Hogg's *Fruit Manual*, it was raised by a person of the name of Cockle, residing at Godstone, Surrey, where it is extensively grown, as also in the neighbouring county of Sussex. I remember it distinctly as a school-boy, so it is by no means a modern Apple. It is worthy a place in a select collection of dessert Apples. *R. D.*

Book Notice.

JOHNSON'S GARDENERS' DICTIONARY.

The appearance of a new and revised edition of a book which has held a foremost place among gardening works for nearly half a century ought not to be allowed to pass without a few words in reference to its history. A brief description, moreover, is especially called for in these columns, considering that the *Gardeners' Chronicle* was the primary source of much of the matter published in the earliest edition of the book in question.

A Dictionary of Modern Gardening was the title of the first edition of the late George W. Johnson's book, which bore the imprint of Robert Baldwin, of 47, Paternoster Row, London, and was dated 1846. It appeared in what is known technically as duodecimo size, its price being half a guinea. It is a stout volume of 704 pages, with eight pages of prefatory matter. It was dedicated to John Lindley, the then high priest of horticulture and botany, and whom the compiler justly describes as "one of the most efficient promoters of modern horticulture."

The aim of the compiler was, as he says, to gather together in one volume, attainable at a moderate price, and arranged in a manner easily consulted,' a complete record of gardening. Mr. Johnson obtained aid from the best living authorities, as well as from their published works. But, he continues, "of all the authorities consulted, none has afforded such abundant information as the *Gardeners' Chronicle*, of which it is not too much to say that, as it is the best of modern journals devoted to promoting the cultivation of the soil; so, whoever is fortunate enough to possess a complete copy of its five published volumes, has a work of reference for which he will rarely turn away unsatisfied if seeking for information relative to its particular subject." The success of this somewhat ambitious venture appears to have been a very decided one, both in this country and abroad. In America, an edition, revised to suit the exigencies of other and extremely varied conditions, was edited by David Landreth and published in Philadelphia in 1847. It contained 180 woodcuts, including a number of outlined diagrams of Apples, Pears, &c.

The first English edition having been well received, a revision was determined upon. In the meantime, Mr. Johnson had projected the *Cottage Gardener*, and had drawn around him a staff of first-rate writers—men of great practical knowledge. The revised edition bore the less ambitious, but certainly less appropriate title of the *Cottage Gardeners' Dictionary*, its publishers being the well-known firm of W. S. Orr & Co., of Amen Corner, Paternoster Row, London. It consisted of 927 pages, which were divided into fourteen monthly parts, the first of which appeared in November or December, 1850. From the preface to the first edition, which is really the second if we begin at the beginning, we learn that Mr. Beaton, gardener to Sir W. Middleton, furnished all the headings descriptive of each genus, the derivation of their names, with their botanical classification and nomenclature; Mr. Fish, gardener to Colonel Sowerby, supplied the cultural directions for each genus of flowering and ornamental plants; Mr. Errington, gardener to Sir P. Egerton, the directions for fruit culture, and the selection of varieties; Mr. Appleby, floricultural manager to Messrs. Henderson, the information relative to florists' flowers; whilst the important department of the kitchen garden was the joint work of Mr. Barnes, gardener to Lady Rolle, Mr. Weaver, gardener to the Warden of Winchester College, and the editor himself.

The new edition differed in many respects from the first issue of 1846. It was not dedicated to anyone, and the references to the *Gardeners' Chronicle* were suppressed, the information which had been derived from these columns having been in a great measure omitted, and replaced by matter from Mr. Johnson's own journal. Lengthy articles on soils were condensed into short paragraphs. On the other hand, subjects which had previously been discussed in a few lines were now elaborated into lengthy monographs. For example, the genus Acacia, which received in the 1846 edition a space of only four lines, was now extended to five columns; and Erica, which had previously been compressed into seven lines, now occupied eight columns. Moreover, the "Calendar" of operations for each month in the year, distributed according to alphabetical arrangement, was entirely omitted.

The periodical issue of the revised edition had not long terminated before a second edition was determined upon. The rapid manner in which the very large impression sold was a flattering testimony to the general utility of the book as a handy work of reference. The second edition of the revised issue was completed in twelve parts, priced at 7*d.*, 8½*d.*, or 10*d.*, according to the quantity of matter, the first part being dated December, 1856. W. Kent & Co., 51, Paternoster Row, London, were the publishers. It was submitted to a considerable amount of revision, as will be seen by the fact that it contained only 857 pages, of which thirty pages were entirely taken by lists of synonyms which did not appear in the earlier issue. Although what seemed to be new editions had appeared in 1863 and 1875, the body of the book remained untouched. In 1868 the first supplement was published by Messrs. Bell & Daldy, which brought the total number of pages up to 916, and in 1880 a further supplement, compiled by Mr. N. E. Brown, of Kew, was issued by Messrs. George Bell & Sons, the publishers of the new edition which has just commenced to appear in shilling monthly parts, under the editorship of Messrs. C. H. Wright and D. Dewar. The names of these gentlemen should afford a guarantee that their work will be well done, and we trust that their revision may be so thorough as to bring the work up to date.

We notice a statement on the first page, where

Abies is given as the Latin equivalent for Spruce Fir, but from the way in which the generic names Picea and Abies have been interchanged, it is no wonder that perplexity exists. We do not think the Horse-Chestnut was ever a native of the tropics, and the very vague locality "Asia" assigned to the tree under the head of Æsculus might with more correctness have been replaced by mountains of Greece. The circumstance that Aucuba japonica "passed from stove to greenhouse and thence to the open air," is no proof of any "acclimatisation" having taken place. The names of plants are well spelt, and the lists have been carefully revised, so that the book will be useful as a register of the more important plants cultivated in gardens, as pains have evidently been taken to incorporate the newer introductions.

The compilers have followed the generic arrangement adopted in the *Genera Plantarum*, from which they have only departed in cases where some genera which are then united, are sufficiently distinct for horticultural purposes—for example, Azalea is wisely, we think, kept quite distinct from Rhododendron. The greatest innovation in the new edition is in reference to the translations of the specific names. These are omitted from the body of the work, but will be given in an appendix. This is in many respects a pity, as the specific name is often helpful in identifying a plant; few gardeners have any knowledge of the Greek and Latin meanings of the names given to plants, and these translations have been one of the chief features of Johnson's *Dictionary*. The new edition also differs from its predecessors in being beautifully printed—the Chiswick Press being responsible for its typography.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Accumulated. Above (+) or below (—) the Mean for the week ending March 18.	Above 42°, for the Week.	Below 42°, for the Week.	Above 42°, difference from Mean since January 1, 1893.	Below 42° difference from Mean since January 1, 1893.	Rainfall. More (+) or less (—) than Mean for the Week.	No. of Rainy Days since Jan. 1, 1893.	Total Fall since Jan. 1, 1893.	Bright Sun. Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 1, 1893.

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending March 18, is furnished from the Meteorological Office:—

"The *weather* continued generally fair and bright over all the more southern parts of the Kingdom, but was unsettled in the north and north-west, where rain fell frequently during the early part of the week, and sleet and snow showers later. Some snow showers were also experienced at many of our southern and eastern stations, but they were mostly very slight.

"The *temperature* continued high during the first half of the period, but subsequently fell rapidly, and became low for the time of year. The averages for the week were rather above the normal in England, as well as in 'Ireland, S.,' and the 'Channel Islands;' elsewhere they were a little below. The highest readings were registered on the 12th, when the thermometer rose to between 64° and 66° over England; in Ireland the absolute maxima ranged from 53° to 56°, and in Scotland, from 51° to 53°. The lowest of the minima were recorded at the end of the week, where they ranged from 16° in 'Scotland, N.,' and 22° in 'Scotland, E.,' and the 'Midland Counties,' to 35° in 'Ireland, S.,' and to 42° in the 'Channel Islands.'

"The *rainfall* was considerably in excess of the mean in 'Scotland, N.,' but less in all other parts of the kingdom. The fall over England was very slight, not amounting to more than 1-10th or 2-10ths of an inch.

"The *bright sunshine* was less than the mean in 'Scotland, N.,' and 'Ireland, S.,' but showed a decided excess elsewhere. The possible amount of duration ranged from 52 in 'England, N.E.,' from 46 in 'Scotland, W.' and the 'Channel Islands,' and from between 39 and 44 in most other districts, to 26 in 'Ireland, S.,' and 18 in 'Scotland, N.'"

Potatos.

Trade still continues very quiet, and prices low for all kinds except first-class samples.

New Potatos. — Arrivals this week rather heavy, best samples making 26*s.* to 28*s.*; medium, 20*s.* to 22*s.*; ordinary, 14*s.* to 16*s.* *J. B. Thomas.*

SEEDS.

London: *March* 22.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, that with a continuance of favourable weather, there is a daily increasing demand for field seeds. Quotations all round are characterised by extreme firmness. For White and Alsike the tendency is upwards. Trefoils are steady. The meagre stocks remaining of French and Italian Rye-grass are rapidly approaching exhaustion. Sanfoin is 2*s.* dearer. Perennials keep firm. For Brunswick and Kœninsberg Tares there is a free sale. Bird seeds move off slowly. Scarlet Runner Beans offer on temptingly low terms. Haricot Beans are in somewhat improved request. There is no change this week in either Mustard or Rapeseed. Blue Peas continue inactive. Linseed in stronger.

FRUITS AND VEGETABLES.

Borough: *March* 21.—Quotations:—Savoys, 3*s.* to 7*s.* per tally; Sprouts, 9*d.* to 1*s.* per half-sieve; Kale, 9*d.* to 1*s.* 3*d.* per bushel; Turnip-tops, 1*s.* to 2*s.*; Broccoli, 1*s.* 6*d.* to 2*s.* per bag; Greens, 1*s.* 6*d.*; Parsley, 3*s.*; Carrots, 2*s.* 6*d.* to 3*s.* 6*d.*; Turnips, 1*s.* 6*d.* per dozen bunches; English Onions, 8*s.* to 9*s.* per cwt.; Dutch do., 6*s.* per bag; Horseradish, 2*s.* 3*d.* to 2*s.* 6*d* per bundle; Apples, 4*s.* 6*d.* to 6*s.* per bushel.

Spitalfields: *March* 21.—Quotations:—English Apples, 6*s.* to 6*s.* 6*d.* per bushel; American do., 18*s.* to 19*s.* per barrel; Savoys, 3*s* to 6*s.* per tally; Cauliflowers, 4*s.* to 7*s.* do.; Sea-kale, 1*s.* 3*d.* per punnet; Curly Kale, 1*s.* 6*d.* per bushel; Sprouting Broccoli, 1*s.* 6*d.* to 2*s.* 6*d.* per sack; Turnip tops, 1*s.* 9*d.* to 2*s.*; Swede-tops, 1*s.* 6*d.* per sack; Sprouts, 1*s.* to 1*s.* 3*d.* per half-sieve; forced Rhubarb, 1*s.* 9*d.* to 2*s.*; natural do., 2*s.* to 2*s.* 6*d.* per dozen bundles; Greens, 1*s.* to 2*s.*; Turnips, 2*s.* to 2*s.* 6*d.*; Carrots, 2*s.* to 3*s.*; Parsley, 6*s.* to 7*s.* per dozen bunches; Mint, 5*s.* per dozen bundles; Horseradish, 2*s.* to 2*s.* 6*d.*; Celery, 1*s.* 3*d.* to 1*s.* 8*d.* per bundle; Beetroot, 3*s.* to 4*s.* per bushel; Mustard and Cress, 2*s.* per dozen baskets; English Onions, 8*s.* to 9*s.* per cwt.; Spanish do., 9*s* to 10*s.* per case.

Farringdon: *March* 23.—Quotations:—English Onions, 10*s.* per cwt.; Carrots, 50*s.* to 60*s.* per ton; Turnips, 45*s.* to 50*s.* do.; Parsnips, 50*s.* do.; Apples, Baldwins, 17*s.* 6*d.* per barrel; Greenings, 15*s.* do.; Grapes, Cape, 7*s.* 6*d.* per box; Pine-apples, 2*s.* 6*d.* to 3*s.* each.

Stratford: *March* 21.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done at the undermentioned quotations:—Savoys, 2*s.* 6*d.* to 7*s.* per tally; Greens, 1*s.* to 1*s.* 6*d.* per bag; do., 1*s.* 6*d.* to 2*s.* 6*d.* per dozen bunches; Cauliflowers, 1*s.* to 1*s.* 6*d.* per doz.; Carrots, household, 40*s.* to 50*s.* per ton; do., cattle feeding, 24*s.* to 40*s.* do.; Parsnips, 6*d.* to 9*d.* per score; Mangels, 16*s.* to 20*s.* per ton; Swedes, 15*s.* to 21*s.* per ton; Onions, English, 200*s.* to 210*s.* do.; do., Dutch, 1*s.* to 1*s.* 6*d.* per bag; do., Bordeaux, 4*s.* to 6*s.* 6*d.* per case; Apples, English, 2*s.* to 5*s.* 6*d.* per bushel; Broccoli, 2*s.* to 2*s.* 3*d.* per bag; do., 1*s.* to 1*s.* 9*d.* per sieve; Turnip-tops, 1*s.* 6*d.* to 2*s.* 3*d* per bag.

POTATOS.

Borough: *March* 21.—Quotations: — English Magnums, 40*s.* to 60*s.* per ton. The rest at last quotations.

Spitalfields: *March* 21.—Quotations:—Magnums, 45*s.* to 70*s.*; Champions, 45*s.* to 60*s.*; Imperators, 55*s.* to 70*s.* per ton.

Stratford: *March* 21. — Quotations: — Magnums, 40*s.* to 65*s.*; Bruce do., 50*s.* to 70*s.*; Imperators, 40*s.* to 60*s.* Scotch Bruces, 65*s.* to 85*s.*; Belgian Magnums, 40*s.* to 60*s.* per ton.

London Averages: *March* 22.—Magnums, 45*s.* to 70*s.*; Hebrons, 60*s.* to 80*s.*; Champions, 45*s.* to 60*s.*; Regents, 65*s.* to 80*s.*; Imperators, 50*s.* to 70*s.*; Belgians, 50*s.* to 60*s.* per ton. New:—Jerseys, 4*d.* to 8*d.* per pound.

Farringdon: *March* 23.—Quotations: — Sutton's Abundance, 80*s.* to 85*s.*; Main Crop, 85*s.* to 90*s.*; Bruce's, 65*s.* to 70*s.*; Magnums, 55*s.* to 65*s.*; Imperators, 55*s.* to 60*s.* per ton.

NOTICES TO CORRESPONDENTS.

*** *NOTICE.—We shall publish a day earlier next week owing to the occurrence of Easter. Correspondents are consequently requested to send in their matter a day earlier.*

Books: *A. B.* We know of no special book upon the subject you name, but you will find useful hints in Cassell's *Popular Gardening*, of which a new edition is now coming out in parts. The subject could not be dealt with satisfactorily in this column.—*J. S. U.* There is no one book that deals with Cryptogamous plants in the manner you wish. The nearest we can advise you is Murray and Bennett's *Cryptogamic Botany*, published by Longmans, price about 6*s.*

Calla æthiopica: *T. B.* It is not at all uncommon to see a double spathed form. We have figured it occasionally, and are surprised that no one has attempted to fix it, either by seed or by division. The process would be slow, no doubt, but it would be worth the trouble.

Hyacinth Failure: *B. P.* The failure is not due to the compost, which is quite suitable. It may, however, be the result of a check received since plants began to grow, such as draught, &c.

INSECTS IN LARCH TIMBER: *J. W.* What you send are saw-flies of the genus Sirex (fig. 54). The female insect perforates the tree to deposit her eggs.

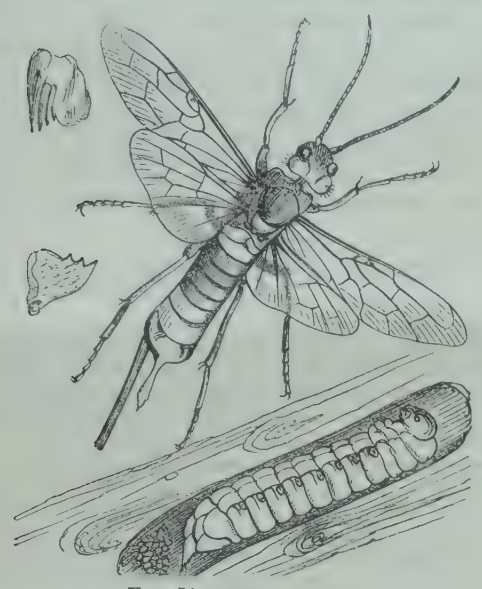

FIG. 54.—SIREX GIGAS.

From these come grubs or maggots, which feed on the wood, and bore channels in it; they do great mischief, and affected trees should be destroyed.

MOSS: *J. M.* We cannot advise you, as we do not know the market value of the moss. Communicate with Mr. Dickson, Covent Garden; or advertise your wares.

NAMES OF PLANTS: *H. A.* Phaius grandifolius.—*C. H., Salisbury.* Wretched scraps; withered on arrival. 1, Forsythia viridiflora; 2, Pulmonaria officinalis; 3, not recognised; 4, Stachys lanata; 5, Tussilago Farfara, Coltsfoot; 6, Veronica Traversi.—*J. M. C.* Rhododendron Nobleanum, a hybrid. Move it immediately it has done blooming, or, better still, in autumn.—*G. D.* Rhododendron argenteum, not Falconeri.—*W. S. P.* 1, Ornithogalum umbellatum; 2, a form of Narcissus Pseudo-Narcissus major; 3, N. juncifolius var.; 4, N. odorus var. minor (so far as we can tell). *C. H. T.* Abies Pinsapo.—*G. A.* Staphylea Colchica.—*T. D.* Narcissus pseudo-Narcissus var. major, and one of the innumerable forms of Scolopendrium vulgare; the others next week.—*L. A. G.* 1, Santolina incana; 2, Epidendrum cochleatum.—*J. M.* The yellow species is Dendrobium suavissimum. It is next to impossible to give varietal names to match fresh imported forms of Dendrobium nobile. Yours seem good flowers; the light one in the way of D. n. intermedium.—*W. J., Bath.* Next week.—*Eureka.* 1, Osmunda regalis? 2, Athyrium Goringianum pictum; 3, Onoclea sensibilis.—*Grower.* Vanda lamellata, Cattleya Trianæ var. delicata.—*D. & Co.* Fuchsia bacillaris.

PELARGONIUMS, TUBEROUS: *W. H. M.* We know of some South African species that have fleshy stems, and which were once in cultivation, but we do not know of any tuberous-rooted varieties.

COMMUNICATIONS RECEIVED.—W. W.—H. J. V.—Dicksons.—J. C. H., Los Angeles.—C. S. C., Boston, U.S.—Dr. F., Los Angeles, California.—H. R.—A. T., Versailles.—J. M. McF., Philadelphia.—C. A. H. C.—E. D. T.—E. H. L., New York.—H. E., Ryde.—M. G., Florence.—J. D. S., Baltimore.—Ch. de B., Lierre.—W. T. T. D.—G. A.—J. P.—H. W. W.—W. E.—W. A. C.—F. K.—T. C.—E. M.—C. Y. M.—W. E. G.—R. D.—G. P.—R. (next week).—E. T. C.—J. W.—J. G. B.—A. G. (next week).—A. J. T.—R. W.—A. E.—W. K.—H. E.

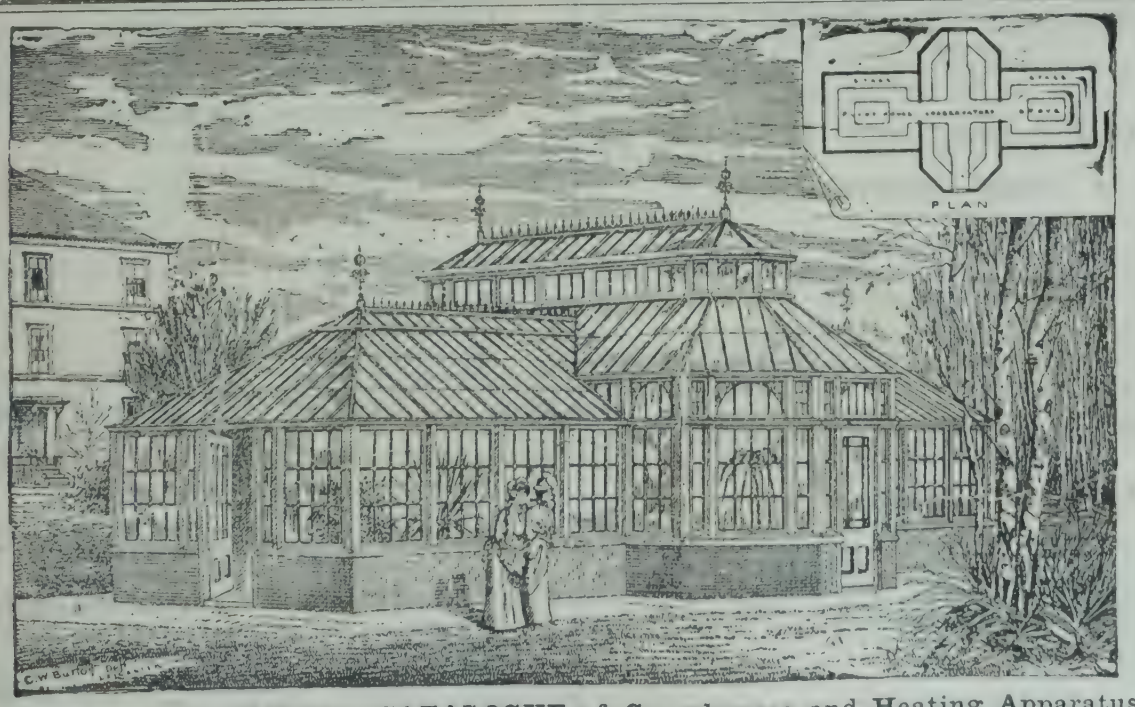
Illustrated Circulars Post-free.
Complete Catalogue, 3s.



MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,
Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**
A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

Testimonials.
"Shirburn Castle, January 5, 1890.
"SIR,—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACCLESFIELD."
"Hornby Castle, Lancaster, February, 1890.
"Major FOSTER has much pleasure in stating that the vineries and forcing-houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."
"Estate Office, Ripley, Yorkshire, January 23, 1890.
"Sir HENRY INGILBY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep it in repair."

WANT PLACES.

TO GARDENERS AND OTHERS SEEKING SITUATIONS.

The pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. *on Wednesday will, in all probability, be held over to the next week.*

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—
F. SANDER AND CO., St. Albans.

THOMAS BUTCHER can recommend several HEAD and UNDER GARDENERS of first-rate character and proved ability. Gentlemen seeking such may have particulars free.—Apply to THOMAS BUTCHER, Seed Merchant and Nurseryman, Croydon.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the *highest* respectability, and *thoroughly practical* at their business. All particulars on application.
Telegraphic and Postal Address—"DICKSONS, CHESTER."

GARDENER (HEAD).—W. FISHER, Gardener to the Earl of Cawdor, Stackpole Court, Pembroke, would be pleased to recommend his Foreman, Charles Davis, to any Lady or Gentleman who is in want of a first-class man.

GARDENER (HEAD); age 30.—J. DUMBLE, Gardener to Sir Charles Philipps, Bart., Picton Castle, Haverfordwest, is desirous of recommending his General Foreman, H. Butcher, to any Lady or Gentleman requiring a thoroughly competent man. He has a good knowledge of the different branches of Gardening, is well acquainted with the Cultivation of Fruit (Indoor and Out), Flowers and Vegetables, is also a most successful Grower of Chrysanthemums for Exhibition.

GARDENER (HEAD).—A thoroughly practical, energetic man desires re-engagement. Twenty-three years' experience in First-class Establishments as Head and Under Gardener; has also had charge of large establishment in the Channel Islands, where Fruit, Flowers, and Vegetables are grown in enormous quantities. Well up in Landscape Gardening, and Management of Land, and thoroughly capable of Managing a First-class Establishment at the lowest possible cost.—W., 32, London Street, Paddington, W.

GARDENER (HEAD), where two are kept.—Age 23, single; seven years' experience, four under Glass; exceptional good references.—H. POLAND, 3, Belle Vue Crescent, Clifton, Bristol.

GARDENER (HEAD).—Experienced in all branches; high character. Will give £5 for information which will lead to his obtaining a good situation.—POMUM, 10, Hanover Square, W.

GARDENER (HEAD), where two are kept.—Age 26, single; twelve years' good experience, Inside and Out. Three and a half years' good character from last situation.—F. B., Orleans House, Twickenham, S.W.

GARDENER (HEAD).—Lady highly recommends the above; thoroughly experienced in all branches. Excellent personal character. Life abstainer.—HAGEN, Ropley, Alresford, Hants.

GARDENER (HEAD); single.—R. GRAY, Gardener to R. Barclay, Esq., Bury Hill, Dorking, Surrey, can highly recommend a Man as above to any Lady or Gentleman requiring a steady industrious all-round Man; has been with him five years. Excellent references. Life experience.

GARDENER (HEAD); age 36, married, one child —A GENTLEMAN can with every confidence recommend his Gardener, who has been with him upwards of six years. Thoroughly experienced in all branches. First-class references from good establishments. Successful Fruit Grower. Can Manage Stock if required.—J. VOSS, Finches, Lindfield, Sussex.

GARDENER (HEAD); married, two children (age 7 and 11).—A GENTLEMAN wishes to recommend his Head Gardener who has been with him six years. Understands Vines, Melons, Stove and Greenhouse Plants, Flower and Kitchen Gardening. Fourteen years' previous good character.—GEO. TURNER, Cranmore Lodge, Elmstead, Chislehurst.

£5, or more, will be given for intimation that will secure situation as HEAD GARDENER. Thorough in all branches. High character. Age 39, married—P. H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD WORKING); age 28, married.—J. MINTON can with confidence recommend a man as above to any Lady or Gentleman requiring a good all-round man. Twelve years' practical experience in all branches.—Burborough, Rawdon Hill, Arthington, Leeds.

GARDENER (HEAD WORKING), man or lad kept.—Middle age, married, no children; twenty-five years' experience. Ten years' good character in present place. Vines, Melons, Cucumbers, Tomatos, Flower and Kitchen Garden; Stock if required.—G. CHILTON, Heacham Lodge, King's Lynn, Norfolk.

GARDENER (HEAD WORKING).—Married; thoroughly experienced.—A GENTLEMAN highly recommends the above, who has been in his service over fourteen years.—B., Tollerton Hall, Notts.

GARDENER (HEAD WORKING).—Age 27; thoroughly experienced in all branches, including Growing and Staging Roses for Exhibition. Strongly recommended by Mr. Frank Cant, Braiswick Nursery, Colchester, my present employer. Twelve years' excellent character from last situation.—HENRY WELLER, Mrs. Cook, West Bergholt, Botolph's Hill, Colchester.

TO FLORISTS, &c.—Situation wanted by a young Man, quick at Wreaths, Sprays, Buttonholes, &c., good Salesman. First-class references.—J. SAUNDERS, 22, Rillebutt Road, Black Rock, Brighton.

HOLLOWAY'S OINTMENT and PILLS.—Sudden changes of temperature sorely try all persons prone to rheumatism, sciatica, tic doloreux, and many maladies scarcely less painful, though of shorter duration. On the first attack of stiffness, or suffering in any muscle, joint, or nerve, recourse should immediately be had to fomenting the seat of disease with hot brine and rubbing in this remarkable Ointment, which will assuage the uneasiness of the part, subdue inflammation, and reduce the swelling. The Pills, simultaneously taken, will rectify constitutional disturbances and renew the strength. No remedy heretofore discovered has proved so effective as the Ointment and Pills for removing gouty, rheumatic, and scrofulous attacks, which affect all ages, and are commonly called hereditary.

CADBURY'S COCOA

ABSOLUTELY PURE, therefore BEST.

"**CADBURY'S COCOA** has in a remarkable degree those natural elements of sustenance which give the system endurance and hardihood, building up muscle and bodily vigour, and a steady action that renders it a most acceptable and reliable beverage."—*Health.*

"The name Cadbury on any packet of cocoa is a guarantee of purity."—*Medical Annual.*

"We have examined the samples brought under our notice, and find that they are genuine, and that the Cocoa Essence is just what it is declared to be by Cadbury Brothers."—*Lancet.*

"**CADBURY'S COCOA** the typical cocoa of English manufacture—absolutely pure."—*The Analyst.*

SHEPPERSON'S NOVELTIES and SPECIALTIES (THIRTY-FOURTH YEAR OF ADVERTISING).

The following Novelties and Specialties, having all been grown in a very exposed situation high up on the Derbyshire hills, are very hardy, stocky, and healthy, very different to weak seedlings grown in warm favoured situations which look nice, but very rarely succeed well. All carriage free for cash with order. Descriptive List free.

CHRYSANTHEMUMS (Special Culture).—Not a collection of old-fashioned sorts, but the cream only of the best English, French, American, and Japanese raisers, including the very latest novelties; good well-rooted plants, 12 for 2*s.*; 25 for 3*s.* 6*d.*, warranted true to name; 12 selected extra varieties, all new, of 1891 and 1892, for 4*s.*

PANSIES (a great specialty).—Five Silver Cups and other prizes, the cream only of the most noted raisers, the latest new sorts and the winners at all the great shows; good plants, correctly named, show or fancy, 12 for 3*s.*; 25 for 5*s.* 6*d.*; 50 for 10*s.* 6*d.*; 100 varieties, 20*s.*; also seed, 1*s.* and 2*s.* 6*d.* per packet.

DORONICUMS (Golden Stars or Hardy Marguerites).—Three distinct first-class sorts—Harpur Crewe, Clusi, and Plantagineum excelsum, 1 each for 1*s.* 6*d.*; 2 for 2*s.* 6*d.*

CARNATIONS, PICOTEES, and CLOVES of the finest named hardy border varieties; many grand new sorts; strong layers, wintered outside, 6 for 2*s.* 6*d.*; 12 for 4*s.*; 25, in twelve varieties, for 7*s.* 6*d.*; also seed from above splendid collection, 1*s.* and 2*s.* 6*d.* per packet.

PHLOXES (Perennials).—Special culture of early and late varieties; the cream only from Downie, Laird & Sons, Kelway, Ware, and other first-class growers; 6 fine varieties, 2*s.*; 12 for 3*s.*, true to name; strong stools to bloom well.

GEUMS.—The new double Scarlet, a splendid hardy free-blooming plant, and fine for cutting; strong two-year-old plants, 12 for 1*s.* 6*d.*; 25 for 2*s.* 6*d.*; 100, 9*s.*

CANTERBURY BELLS.—Grand new colours and new forms, double and single Telescopes, Hose-in-Hose, Cup and Saucer, and other varieties; 12 plants to bloom well, 1*s.* 6*d.*; 25 for 2*s.* 6*d.*; 100, 9*s.*; also seed, 6*d.* and 1*s.* per packet.

VIOLAS, during the last few years, have come to the front as few flowers have ever done; they are wanted everywhere, and very few plants produce so fine a display for so little trouble. I have a grand collection, including many new varieties; 12 varieties, named, 2*s.*; 25 for 3*s.* 6*d.*; 100, 12*s.*; seed, 1*s.* per packet.

12 Pure Snow-white Garden PINKS, sweetly scented, 1*s.* 6*d.*; 25 for 2*s.* 6*d.*; 100, 9*s.*

NEW WHITE BORDER PINK, Her Majesty (Ware).—Flowers very full, very large, and remarkably strong; constitution pure white and fragrant; has received a large number of first-class certificates; a really grand new variety; 2 for 1*s.* 6*d.*; 3 for 2*s.*; 6 for 3*s.* 6*d.*

12 Beautifully Spotted or Pure White FOXGLOVES for 1*s.* 6*d.*; 25 for 2*s.* 6*d.*; 100, 9*s.*

NEW HARDY JAPANESE PRIMULAS (Hybrids of Primula Sieboldi).—This new class of hardy Primula, which has become so popular either for the outside border or the greenhouse; since its introduction it has been greatly improved, the new varieties being really grand. The following collection is the production of Mr. Geggie, the celebrated raiser, whose collection has gained first prizes, gold medals, and first-class certificates at the Crystal Palace, Royal Horticultural, Royal Botanic, and other important societies; 6 distinct varieties, named, 3*s.*; 12 for 5*s.*

AURICULA (Alpines).—A splendid collection, the result of many years' careful selection; strong plants, to bloom well, very different to untried seedlings, 12 for 3*s.*; 25 for 5*s.* 6*d.*; seed, 1*s.* per packet.

ASTERS (MICHAELMAS DAISIES).—Unrivalled hardy autumn-flowering border plants, and for cut flowers; a grand collection of the latest improved colours, as pure white, pink, bright mauve, &c.; 6 distinct sorts for 1*s.* 6*d.*; 12 for 2*s.* 6*d.*; 25, in twelve varieties, 4*s.* 6*d.*

CARNATIONS, PICOTEES, and CLOVES.—Strong year-old plants, seedlings from the finest named varieties, will produce 80 per cent. of fine double flowers of the very best colours only, such as white, pink, scarlet, crimson, purple, yellow, striped, spotted, &c.; 12 varieties, 2*s.* 6*d.*; 6 for 1*s.* 6*d.*; 100, 15*s.*

MALVA MOSCHATA.—Pink and white, hardy border plants, grand for cutting, 1*s.* 6*d.* per dozen; 25 for 2*s.* 6*d.*; 100, 9*s.*

POPPIES have now made their way to the front, and none are so popular as the hardy perennial varieties Nudicaule and Orientalis, free and continuous flowering, and bright striking colours; 6 for 1*s.* 6*d.*; 12 for 2*s.* 6*d.*; 25 for 4*s.*

GAILLARDIAS (Perennial hybrids).—A really grand collection of these most gorgeously-marked hardy plants, colours scarlet, crimson, and gold of different shades; blooms all the summer; 6 for 1*s.* 6*d.*; 12 for 2*s.* 6*d.*; 25 for 4*s.*

PYRETHRUMS (Double and Single).—A grand collection to name, selected from the best English and French raisers; as a hardy, free-flowering, easily-grown plant for all purposes, the Pyrethrums are among the very best; 3 named varieties, 1*s.* 6*d.*; 6 for 2*s.* 6*d.*; 12 for 4*s.*

CARNATION MARGUERITE.—This grand novelty has proved itself to be the most remarkable of all the Carnation family; it commences blooming early in summer, and goes on till late autumn; it will produce quite 80 per cent. of fine double flowers of the most beautiful colours and markings; 12 for 2*s.*; 25 for 3*s.* 6*d.*

AURICULA (Alpina), the real old Irish Dusty Miller.—A most beautiful hardy, easily-grown, sweetly-scented, free-flowering variety; 6 strong plants, 2*s.*; 12 for 3*s.*; 100, 20*s.*

IRIS GERMANICA.—Rivals of the famed Orchid flowers, of peculiar formation, and most exquisitely marked with many bright and distinct colours; quite hardy; 3 named varieties for 1*s.* 6*d.*; 6 for 2*s.* 6*d.*; 12 for 4*s.*

POLYANTHUS & PRIMROSE HYBRIDS.—Splendid mixed colours; finest strain grown; 12 for 1*s.* 6*d.*; 25 for 2*s.* 6*d.*; 100 for 9*s.*; all good hardy blooming plants; also seed, 6*d.* and 1*s.* per packet.

DELPHINIUMS.—A splendid lot raised from twelve new varieties of Kelway's double and single, including Lord R. Churchill, Melton, James Kelway, and others; good plants, to bloom well, 6 for 2*s.*; 12 for 3*s.*; 50 for 10*s.*; also seed, 6*d.* and 1*s.* per packet.

PRIMULA CASHMERIANA.—A really fine spring-flowering plant, colour bright mauvy-violet; free bloomer; should be in every garden; 3 for 1*s.* 6*d.*; 6 for 2*s.* 6*d.*; worth double.

CAMPANULA PERSICIFOLIA.—Single white, double white, double blue, and grandiflora. All quite hardy and unrivalled for border decoration, cut flowers, wreaths, &c.; 1 of each for 1*s.* 6*d.*; 2 of each for 2*s.* 6*d.*

ARABIS ALBIDA VARIEGATA.—A splendid variegated variety for the rockery or front rows, to beds and borders; flowers pure white; 6 for 1*s.* 6*d.*; 12 for 2*s.* 6*d.*

12 HARDY PERENNIAL BORDER PLANTS (named), distinct and useful for decoration and cutting purposes, 2*s.*

12 DISTINCT PLANTS for Windows, 2*s.*

GERMAN SCABIOUS.—Eight distinct colours of this most beautiful, hardy, free-flowering, easily-grown attractive plant; really grand for border decoration and cut flowers; 12 for 1*s.* 6*d.*; 25 for 2*s.* 6*d.*

HOLLYHOCKS.—Warranted all fine double flowers, Chater's select strain; strong year-old plants to bloom this summer; 12 varieties, 3*s.*; 6 varieties, 2*s.*

SPECIAL OFFER of 100 strong healthy plants of fancy and show PANSIES and VIOLAS for an early and extra show for the borders, unnamed, 10*s.*; or 50 for 5*s.* 6*d.*

STRAWBERRY PLANTS.—A grand collection, including many grand new varieties from the best English, French, and American raisers, 3*s.* per 100.

SAMUEL SHEPPERSON, Florist and Seedsman, PROSPECT HOUSE, BELPER, DERBYSHIRE.

THE

Gardeners' Chronicle.

SATURDAY, APRIL 1, 1893.

DAFFODILS FOR MARKET.

A GREAT market flower is the Daffodil. It is sent in tons from the sunny Scilly Isles, and in smaller quantities from the South of Ireland, to the London markets before those in England have shown much above the soil. Daffodil time lasts from mid-January until mid-May, but the most interesting season is April, when the flowers from such grounds as Mr. Barr's at Ditton, Mr. Hartland's at Cork, or Mr. James Walker's at Ham, fill the market with colour. A few hours spent in the last-mentioned Daffodil farm—one can call it nothing else—is interesting. Few of the thousands who purchase the splendid blooms at Covent Garden know that they were produced not many miles from London.

On the outskirts of the breezy Furze common at Ham, and adjoining an ugly church where lie the remains of the late Sir Richard Owen, Mr. Walker has many broad acres of rich land devoted to the cultivation of the Narcissus. Enter by a countryfied gateway just off the main road to Kingston, and you are in a veritable Daffodil farm, not entirely devoted to the culture of the bulb, it is true, but it is the chief "article" of industry. Immense glass structures are erected for the growth of Peaches, Tomatos, and other market fruits, and passing these Mr. Walker's residence is a conspicuous feature. From the drawing-room window the view extends to the town of Kingston on the right, and on the left the famous Richmond Hill and the glorious park give beauty to the landscape. A bright sunshiny April day, the air clear, and the flowers in their full beauty, such is the picture the artist would care to transfer to canvas. The noble trees in the park are a framework to the acres of flowers dancing to the soft wind, the glaucous growth glinting in the sunlight. Masses of each variety are grown in long raised beds, a blaze of yellow or a sheet of purest white, as if enshrowded in a mantle of snow, greeting the eye. The acres of bulbs in the low countries are a brilliant sight, but an English Daffodil farm is as beautiful, yet few know that the cultivation of the bulb is carried on extensively on the threshold of the smokiest and, to many, most unpleasant city in the world. Richmond is full of attractions to the lover of Nature—the winding Thames, the glorious view from the Terrace, but thousands of Narcissi flowers colouring the ground with yellow of all shades, form not the least interesting feature in the neighbourhood of this river town.

All who are ardent cultivators of the Narcissi, or take an interest in the flower, are acquainted with Mr. Walker, who has through

many years worked steadfastly and earnestly in the cultivation of the Narcissi for the market. He is the great market Daffodil grower, not a collector. Those who wish to see a collection would probably suffer disappointment, although in a sunny border near the house there is a choice series of the more important forms. Mr. Walker when he first commenced seized upon a few of the leading kinds, those of decided colours which are likely to please the critical taste of the British public, and grew those alone on a large scale. It is necessary to take many points into consideration when growing the Narcissus for market. The variety must be of strong vigorous growth, increase well, and bear freely its bold handsome flowers, of fine colour, as Empress, or the popular N. poeticus. Weakly kinds, with flowers of pale uninteresting colours, are valueless. They do not pay to cultivate. The visitor will observe this in a walk round the Narcissus grounds at Ham; and if he has seen the fine groups shown occasionally by Mr. Walker at the meetings of the Royal Horticultural Society—at the Daffodil Conference held at Chiswick in April, 1890, in particular—he will be prepared to find that the bulb is thoroughly well cultivated.

In Mr. Walker's interesting paper on "Daffodils for the London Market," read before the Daffodil Conference, he mentioned that the flower has increased greatly in popularity. One can well understand this, as in every house it is usual to see the flowers, oftentimes arranged with great taste. A bowl of Daffodils, with a few sprigs of the chocolate-bronzy-leaved Mahonia aquifolia, is a rare contrast of colour. Interesting information is vouchsafed to the question "Will the competition amongst growers prove too keen in the future to make the flowers pay?" Mr. Walker declares that, if we compare the prices which the blooms realised in 1885 with those of the present year, he is satisfied there has been a fall of 50 per cent. "Large quantities of outdoor English-grown Daffodils were sold last year (1889) as low as 9*d.* for a dozen bunches, with a dozen blooms in each bunch, a price that cannot pay; but when the grower has them in market, it is better for him to take even that price than throw them away. This may be taken as the minimum. On the other hand, as much as 12*s.* has been obtained for the same quantity."

There seems, however, no decrease in Mr. Walker's acreage of Narcissi, and each April the same beautiful picture of colour is presented to view. The varieties are few in number, and planted, as a rule, in long beds, five rows to each bed, the surface of the soil raised a little above the general level, to throw off rains, as a stagnant soil is hurtful. This may be noticed where the ground slopes away, the growth being less vigorous than in the more exposed and drier spots. No definite rule can be laid down as to the cultivation of the Narcissi, some varieties requiring different treatment to others, but Mr. Walker thinks cultivating all alike the best. He planted a bed in strong soil, and at the end of two years lifted the bulbs to discover what progress had been made, finding, however, that the forms known as Capax and Cernuus plenus had gone, whilst the robust varieties, Emperor and Empress, had increased fourfold. The plan is to grow the wild forms, or those supposed to be so, apart from the garden kinds, the latter not receiving manure. The ground for the Narcissi is first thoroughly well ploughed, as everything is done on a market scale, and the bulbs are lifted each season. This is a point of the greatest importance, and those who are troubled with Narcissi that refuse to flower are usually at fault, through permitting the bulbs to remain too long in the soil without lifting or dividing. Every two or three years, at the outside, they should be taken up and replanted. Mr. Walker dries and cleans the bulbs before planting, and commences to plant again in August, the first Narcissus to be dealt with being N. poeticus ornatus, the whole business being finished before September is over. The time of planting the various kinds is when the swelling appears around the base of the bulb. During the autumn, the beds are raked or harrowed once every ten days, and in spring hoed, this being done when the growth peers up through the soil. Annual lifting and replanting, in good free soil, with the manure when given not allowed to exactly touch the bulbs, and proper attention at all times, are the chief points in the culture of the flower for the market.

The two finest varieties for the market are Horsfieldi, raised by a Lancashire weaver named Horsfield, and Empress, which is considered the finer of the two. The flowers are very similar, but more robust, lasting longer, a great consideration, and the bulbs increase rapidly. The superb blooms of both varieties shown by Mr. Walker and to be seen at Ham, are a pleasure to witness, being fully twice as large as those usually grown in gardens. Empress may be considered the finest of all Daffodils, a noble flower for cutting, and delightful in broad borders, or in clumps on the rockery. Grandis, J. B. M. Camm, Maximus, the early-flowering Golden Spur, Countess of Annesley, Ard Righ, and Henry Irving, are also well spoken of, and represented by fine breadths at Ham. The N. obvallaris, usually called the "Tenby Daffodil," is one of the most popular kinds, the flowers of perfect shape, self yellow in colour, and sell by thousands in late March. The white or pale sulphur-coloured forms, of which N. cernuus is the type, are not good market flowers. The colour is against them, and the bulbs are fastidious, but Mr. Walker grows N. cernuus, its form called pulcher, and Mrs. F. W. Burbidge, in fair quantity.

A Narcissus that is in favour at Ham is Sir Watkin, which is grouped under the section N. incomparabilis. It is a bold telling flower, strong in both constitution and eye-pleasing colour. The varieties Gloria Mundi, Stella, and Princess Mary are also well thought of. One might enumerate a fairly long list, but it is Sir Watkin, Empress, and the varieties of N. poeticus that are grown more largely than any others; thus N. p. ornatus is cultivated in thousands; N. p. grandiflorus, N. p. poetarum, and N. p. recurvus following in succession. The great British public seem passionately fond of the white fragrant flowers. N. odorus and its variety N. angulosus are also never without purchasers. The double white form of N. poeticus, and such favourites as Orange Phœnix and Sulphur Crown are all cultivated on a good scale.

At this season of the year men and women are busy picking the flowers from the waving rows of foliage, and they are invariably gathered before fully expanded. Several houses are reserved for them, and here in pots of water, they open out fresh and fine, unsullied by the weather that would quickly destroy their beauty for the market. It is important to notice that all the varieties must not be treated alike, the form of N. poeticus called recurvus being gathered quite in the bud stage, before it has burst, but N. poeticus ornatus must be more developed, and the "trumpet" kinds almost open.

The flower-shed is a pretty sight in the height of the Narcissus season. Women are busily at work bunching the flowers, usually into twelves, and making them ready for the market. The air is redolent with the sweet fragrance, yet the whole tone of the place is one of business. England is a fine country for the Narcissus, everyone must admit, after a visit to the acres of flowers at Ham. This is Mr. Walker's experience, and bulbs of N. p. ornatus from the Riviera examined with those of this country, show that those of the latter are infinitely superior. It is pleasant to know that this great Narcissus grower's opinion is, that if the demand for bulbs for forcing goes on increasing at the present rate, it can be met, and that of America also. No competitors need be feared if the bulbs are lifted annually and replanted, and this important work done at the proper time. Seasons vary greatly, but the first weeks in April are usually the best time to see the flowery acres at Ham. *V.*

New or Noteworthy Plants.

IRIS (ONCOCYCLUS) ATROFUSCA,
*Baker, n. sp.**

This very distinct new species of the Oncocyclus section of Iris has been imported in a living state from the little-known region on the east side of the River Jordan in Palestine, by Messrs. Herb & Wulle of Naples, who have sent me a couple of specimens which they have flowered in the middle of March. It is as tall as Iris susiana, but the outer segments of the perianth are much shorter, and a concolorous brown-black. The inner segments are 1 inch longer than the outer ones, and twice as broad, and a mottled dark claret brown with black veins. Professor Foster, in an elaborate paper in the *Garden*, and in a lecture before the Royal Horticultural Society, has recently dealt fully with all that is known about this interesting group of Irises, including their root-structure and mode of growth. It is probable that many more species still remain to be discovered.

Leaves weak, ensiform, a foot long at the flowering time, and nearly an inch broad, pale green, slightly glaucescent. Peduncle stout, one-headed, nearly 1 foot long, hidden by two large sheathing leaves. Spathe-valves pale green, ventricose, much imbricated, 3½ to 4 inches long. Pedicel short, stout. Ovary oblong. Perianth-tube cylindrical, green, 2 inches long. Outer segments of the perianth obovate-cuneate, 3 inches long, 1½ inch broad, nearly black, and quite concolorous on the recurved face, with a broad cushion of concolorous velvety hairs at the base of the recurved portion, which extends all down the claw, where the brown-black hairs are mixed with yellow ones. Standards orbicular, unguiculate, nearly 4 inches long by 3 inches broad, dark claret-brown with radiating black veins. Style-branches 2 inches long, ½ inch broad, very convex on the back and acutely-keeled, with two large quadrate recurved crests. Anther white, ¾ inch long; filament short. *J. G. Baker.*

Dammann's New Hybrid Narcissi.

I have just received from Messrs. Dammann & Co., of Naples, specimens of three interesting hybrid Narcissi. They are all three crosses between forms of N. Tazetta and forms of N. Pseudo-Narcissus, and differ from the hybrids with which we are familiar in this country, such as incomparabilis, Leedsii, poculiformis, Sabini, Humei, Backhousei,

* *Iris* (*Oncocyclus*) *atrofusca*, Baker, n. sp. — Foliis ensiformibus pedalibus flaccidis leviter glaucescentibus; caule elongato monocephalo unifloro; spathæ valvis ventricosis pallide viridibus diu imbricatis, pedicello brevi; perianthii tubo elongato; segmentis exterioribus obovato-cuneatis facie atrofuscis concoloribus, medio barbâ diffusa præditis, segmentis interioribus multo majoribus orbicularibus unguiculatis atropurpureis venis nigrescentibus percursis; styli ramis magnis recurvatis.

and Macleaii, by the predominance of Tazetta characters, the flowers ranging from two to five, with long pedicels, and the large membranous Tazetta spathes. They all have rather glaucous leaves, half or three-quarters of an inch broad, with a flattish face, and a rather glaucous faintly two-edged scape. The Tazetta parent in each case is evidently one of the narrow acute-petalled Mediterranean forms, as is evidenced by the stellate character of the flowers. The differential characters are briefly as follows:—

N. Margaritæ, Hort. Dammann.—A cross between papyraceus and some Pseudo-Narcissus form, probably moschatus. Flowers in an umbel two or three; pedicels nearly an inch long; perianth tube obconic, a little under an inch long, half an inch in diameter at the top, milk-white in the upper half, tinged with green towards the base; perianth segments lanceolate from an ovate base, milk white; corona obconic, half an inch long, five-eighths of an inch diameter at the throat, milk-white at the base, faintly tinged with sulphur-yellow upwards, with an irregularly crenate rather crisped erect edge. Named after the Queen of Italy.

N. Fenzii, Hort. Dammann.—A cross between Pseudo-Narcissus and probably some corcyrensis form. Flowers in an umbel three or four; pedicels about an inch long; perianth tube subcylindrical, three-fourths to seven-eighths of an inch long, quarter of an inch diameter at throat, white upwards, greenish towards the base; perianth segments as long as the tube, linear oblong, whitish; corona campanulate, bright lemon-yellow, half an inch long, half an inch in diameter at the throat, with a spreading crenate margin. Named after Signor Fenzi, editor of the *Bulletin of the Tuscan Horticultural Society*.

N. Sprengeri, Baker.—Tazetta parent aureus, Pseudo-Narcissus parent presumably muticus. Flowers in an umbel five; perianth tube subcylindrical, three-quarters of an inch long, green at the base, yellow upwards; perianth segments lanceolate, pale yellow, as long as the tube; corona obconic, half an inch long, one-third to half an inch in diameter, bright yellow, with an erect truncate throat.

All the three flower at Naples early in March. *J. G. Baker, Herbarium, Kew.*

Crocus luteus var. striatus.

Colonel Trevor Clarke sends me a form of the ordinary Dutch Crocus, which he has raised, with three distinct black stripes on the back of the outer segments of the perianth. A similar form is figured (*Bot. Mag.*, t. 938) under the name of C. sulphureus striatus, but in this the ground colour is pale yellow, whilst in Colonel Clarke's plant it is orange. *J. G. Baker.*

Odontoglossum Ruckerianum splendens.

This is one of the very handsomest of the natural hybrid Odontoglossums. In the size of its flowers, and the breadth of its sepals and petals, it is equal to a good O. crispum, but the labellum, although larger than other forms of its class, has the true O. lanceans form. The sepals and petals are white, tinged with rose, after the manner of O. crispum fastuosum, both sepals and petals being profusely spotted with dark red. The labellum is yellow, with dark-rayed lines at the base, and with a single large irregular red blotch in the centre. It is in the possession of Sir Trevor Lawrence, Bart., and at Burford they are not much given to supplying distinguishing names to the variable forms of Odontoglossums and other Orchids, but it would not be right to allow such a noble form to remain without some indication of its quality. *James O'Brien.*

The Late ERNST BENARY.

ERNST BENARY.

There will scarcely be a seedsman in the United Kingdom to whom the name of Ernst Benary is not familiar as representative of one of the most extensive seed-growing industries in the world; and who will not have learned with regret, from our previous announcement, that the head and founder of this renowned Erfurt seed firm died of inflammation of the lungs on Sunday morning, February 19, after an illness of only two days.

Ernst Benary was born at Cassel on November 10, 1819. His far-reaching knowledge of everything connected with horticulture was attained by early diligence in the great nurseries of England, France, and Belgium. While in this country, he was for a time with Messrs. Hugh Low & Co., at Clapton. On April 1, 1843, he founded, in Erfurt, an establishment for seed-growing. Gradually his business grew, in consequence of Mr. Benary's industry and knowledge of commercial plants, which led him to the perfecting of every sort of vegetable and flower that he took in hand. He never deviated from the principle of introducing nothing which after repeated trials was not proved to be a real improvement. If anyone were to attempt to compile a list of all the novelties of sterling value, both in vegetable and flower seed which Mr. Benary has introduced, it would occupy a considerable space.

The business connection at Erfurt soon spread beyond the limits of his own country, and the effects of his labours are now evident in every department of horticulture, and in all parts of the civilised world. Mr. Benary was the most distinguished of those who, beginning half a century ago, have made the reputation which Erfurt now enjoys as one of the greatest centres of the seed growing industry.

One of the most remarkable developments of Mr. Benary's huge business in later years occurred when he took in hand the Carnation. A dozen or more years ago he sent to this country a number of plants of a singularly dwarf and robust strain, with large handsome double flowers, exhibiting tints of colour quite new to English lovers of the flower. Then came the glorious yellow self, Germania, still the finest yellow self in cultivation, and likely to be foremost for years to come. Later in time came such fine varieties as Theodore Van Dyck, Stadtralle Bail, Claude Lorraine, Cordula, Henrich Engal, Justus Meyer, Richard Tryan, Schlieben, and others, quite justifying the high opinion expressed of them by Mr. E. S. Dodwell in his new edition of his work on the Carnation. No such distinct fancy Carnations as Theodore and Van Dyck have emanated from any other raiser.

From Mr. Benary's achievements in his profession, and services thereby rendered to his town and native country, he was nominated by the Emperor "Geheimer Kommerzienrat," a title which has no equivalent in England, but which may be rendered "commercial privy councillor." It is the highest honour to which a merchant in Germany can aspire.

In 1891, Mr. Benary took a leading part in the reception and ceremonies of welcome which took place on the occasion of the visit of the Emperor to Erfurt, when he personally received as his guest the King of Saxony during the stay of the royal party. The town of Erfurt loses in the departed an excellent citizen, and the poor and afflicted of his neighbourhood a generous benefactor, whose liberality, while unstinted, was of the order that lets not the left hand know what the right hand doeth. Next to the bereaved family none feel his loss more than the numerous *personnel* of his business, for whose welfare he founded several funds which he liberally endowed.

The many British nurserymen and seedsmen who have visited Erfurt, and enjoyed the privilege of his

*

personal acquaintance, will certainly remember with mingled pleasure and regret the amiable disposition of their host, and the kindly reception they met with.

We learn that by the death of its founder no change will be made in the firm, as the two sons, who have been for many years partners in the business, will continue it on the same lines and in the same spirit as heretofore.

ARRIVAL AND PRICES OF VEGETABLES.

It will be useful to give the following Table showing the dates of the arrival of vegetables from different countries, the prices made for them, and the average prices for English vegetables, with the approximate time of their arrival in market:—

IMPORTED VEGETABLES.

Name of Vegetable.	Date of Arrival.	Country from which Sent.	Price.
New Potatos ...	January to May	Algiers and South of France; Lisbon, Holland	2d. to 4d. per lb.
Asparagus ...	March to June...	Spain and France; Toulouse, Dijon, Paris	4d. to 1s. per bundle.
Cauliflowers ...	Feb. to April ...	North of France and Channel Islands	7d. to 1s. 6d. per doz.
French Beans...	April to June ...	France	9d. to 1s. per lb.
Peas	January to July	Africa and France; Algiers, Bordeaux, Toulon	3d. to 8d. per lb.
Lettuces ...	Dec. to June ...	France (Paris)	6d. to 1s. 2d. per doz.
Radishes ...	April	France (Paris)	1d. to 1s. per doz. bunches.
Endive... ...	Dec. to August...	France (Paris)	1s. to 1s. 9d. per dozen heads.
Onions	Dec. to February	Lisbon, France, Holland ...	5s. to 8s. per cwt.
Carrots... ...	April	France	1d. to 10d. per bunch.
Cucumbers ...	May	Holland	1s. 6d. per doz.

ENGLISH VEGETABLES.

Name of Vegetable.	Date of Arrival at Market.	Price.	Estimated Average Crop per Acre.
Potatos, New ...	End of June ...	Not quite 1d. per lb. ...	... 4 tons 10 cwt.
Asparagus ...	May	1s. 3d. to 3s. per 100 heads.	
Cauliflowers ...	End of April ...	8d. to 1s. 4d. per doz.	
Scarlet-runners...	July	2s. to 3s. per bushel ...	... 300 bushels.
Peas	End of June ...	2s. to 3s. 6d. per bushel ...	... 150 bushels.
Lettuces ...	End of May ...	6d. to 1s. per score... ...	... 1,400 score.
Radishes ...	May	4d. to 8d. per doz. bunches	... 1,200 doz. bunches.
Onions	May	1s. to 2s. 6d. per doz. bunches.	
Carrots	June	1s. 6d. to 2s. 9d. per doz. bunches	400 doz. bunches.
Cucumbers ...	July	6d. to 2s. 6d. per doz. ...	... 200 barrels.
Cabbages ...	End of April ...	1s. to 2s. 9d. per 5 doz. ...	... 1,000 dozen.
Coleworts ...	Feb., according to season	9d. to 4s. per doz. bunches	... 250 doz. bunches.
Marrows ...	August	6d. per doz.	

—*C. Whitehead, in "Hints on Vegetable and Fruit Farming."*

ORCHID NOTES AND GLEANINGS.

DENDROBIUM NOBILE NOBILIUS AND D. N. VARIETIES.

Of late, everybody seems to have good varieties of Dendrobium nobile from the later importations, and many think they have better forms than anyone else. But before the whole of the coloured varieties there stands the true D. nobile nobilius, which is up to the present unapproached and seemingly unbeatable. A flower of it sent by John Mills, Esq., Bisterne Park, Ringwood, Hants (gr., Mr. J. Cooper), presents it in all its glory. The flower is over 4 inches across, the petals 1¼ inch wide, the whole flower of the richest purplish-crimson except the base of the segments, and the rich maroon disc and white zone of the lip. It comes opportunely, for Mr. Nelson Campany sends from Thedden Grange Gardens, Alton, Hants, a very fine set of varieties of D. nobile imported from the Eastern Himalayas in 1888, asking if the richest coloured one is D. nobile nobilius. Comparison with that from Mr. Mills shows that beautiful though it be, it is not the least like the king of the nobiles. The No. 8 of Mr. Campany, is a charming light form tipped with carmine, and with a deep mulberry-coloured disc to the labellum. It, as well as the other forms sent, are characterised by the unusually long foot-stalks of the flowers, which, in this case, are 3 inches in length. The other varieties match best with the D. n. elegans and D. n. pendulum, which used to be so fine in the nurseries of Messrs. Rollisson before their decline. No. 6 has the tint of D. n. cœrulescens, but much larger flowers. The whole set are beyond the average in quality, and do great credit to the grower.

Dendrobium Wardianum.

What a magnificent thing Dendrobium Wardianum is, is displayed in the highest degree by flowers sent by R. B. Cater, Esq., Westfield House, Bath, and as they are otherwise interesting, it will be well to let his grower, Mr. W. Jansen, tell his own tale. He says, "I send you flowers of Dendrobium Wardianum 4¼ inches across, and I think you will say grand in colour. These flowers are off a small plant, from which every bulb was pruned, except the current year's growth. It carried three bulbs, of twelve flowers each. This was the only plant I pruned as an experiment, and the flowers are larger and better than on the seventeen unpruned plants, although some of them being large specimens are still very fine, some carrying six to seven dozen flowers each." A very pretty form of Cattleya Trianæ delicata also comes from the same gentleman.

THE HARDY FERNERY.

(*Continued from p.* 323.)

All Ferns in pots should now be overhauled; if overgrown with Marchantia or Conferva, this should be entirely removed, and if it be seen that worms are present, the plants should be shaken out and repotted twice; not only does the soil become soured, and the drainage impeded by worms, but the roots are apt also to suffer by the disturbance they cause, even if they are not actually devoured. If slugs are troublesome, a sharp look-out during these operations should be kept for their eggs, batches of which may frequently be found snugly ensconced in the pots, all ready to produce a little brood of marauders as soon as the spring warmth begins to be evident. Hardy Fern-spores, sown now and given a little warmth, will have the benefit of all the growing-season before them, when they throw their little plants in May, as they should do under such stimulus. If sown much later, or subjected to quite cold treatment, they frequently do not produce plants until late in summer, and hence are not fairly established before the growing-season ceases. They may be sown on small lumps of loam, scattered on the surface of an open, well-drained compost; but the whole must be previously saturated with quite boiling-water, to kill embryo worms and germs of fungi and confervoid growths, which otherwise will surely assert themselves. This done, the spores should be very thinly scattered over the surface, and the pan covered with a glass, and placed in a damp, warm corner of the greenhouse, where it gets plenty of light but no sun. The prothalli may be visible in about fourteen days. Should drought be threatened, the pot or pan should be dipped to the surface-level of the soil in clear tepid-water, until it is just seen to glisten between the lumps of loam; if watered overhead, failure is almost certain.

It should be borne in mind that many of the varietal forms of hardy British Ferns far transcend in beauty the common ones from which they have sprung, and which no Fern connoisseur would think of growing at all. Many a cool conservatory would be immensely improved by the introduction of these, which, though quite as hardy and easy to grow as their commoner progenitors, can hold their own with the finest exotics, if only the same care and attention be devoted to them. We have, however, only too often seen them delegated to quite unsuitable positions, under stages and elsewhere, instead of occupying the posts of honour to which they are justly entitled. *Chas. T. Druery.*

KEW NOTES.

Illicium floridanum.—This interesting plant is in bloom in the economic-house at Kew. The Illiciums are closely allied to the Magnolias, and the present species is the most beautiful of the genus—the only one, in fact, worth growing, unless for economic purposes. I. floridanum was introduced into England as far back as 1766, and is rare in English gardens. John Ellis, who introduced the well-known Venus' Fly-Trap, was the first to send it over from Florida, and a figure appears of this interesting species in the *Botanical Magazine* of the year 1799 (t. 439). Popularly, it is known as the Aniseed tree, and is of medicinal value. The shrub is of distinct beauty, compact in growth, the leaves ovate, bright green, and when bruised, exale a not unpleasant odour; whilst the flowers are carried in clusters in the axils of the leaves. The petals are narrow, intense crimson, and twisted. A shrub in full bloom is of rare beauty, the colouring of the flowers distinct and rich. It is well worth growing in a warm house, but is too tender for the open air, unless in sheltered spots in southern England. In a warm house, however, it reveals its true character, and as seen by the specimen at Kew, must not be kept in too sunny a spot, whilst abundance of water is also necessary. Moisture and shade are the two most important points in its cultivation, and it is under these conditions the plant is found in its native country, where it affects the banks of rivers. The most recent figure of it was the coloured plate in the *Garden*, August 17, 1889, which shows that the shrub is not only richly attractive, but blooms with great freedom. *V.*

CULTURAL MEMORANDA.

RHUBARB.

This, like so many other things, should not be grown too long on one plot of land. Young healthy crowns always force more readily, and give better produce than old ones. Fresh plantations on good ground, which cannot possibly be too rich, will soon make useful clumps, and where much has to be forced yearly, it is better to plant a few annually to meet the demand, as the old forced stools are of little or no use.

Mint.

One of the most useful of herbs. The roots, after being taken up and divided, may be planted in beds, and give every satisfaction; but the most suitable way of increasing the stock, is to pull up small pieces, when 3 to 6 inches long, and dibble them in beds at 10 inches apart. These soon make fine bushes, and produce strong roots for forcing next spring or winter, as may be required. *H. Markham.*

A TRAVELLER'S NOTES.

Yokohama, March 28, 1892.—Yokohama was but a small fishing village until selected by the Americans on account of its good anchorage as one of the treaty ports. It therefore follows that the fine temples, &c., and general objects of interest for which many Japanese towns are famous are here, I may say, entirely absent. The verdict is, and the professional guides second it, there is nothing to see in Yokohama.

It is very cold in Japan, and everything is very backward; Maples and other deciduous plants showing no signs of breaking yet, whilst many plants, such as Cycas, Rhapis, and Ferns are still kept in sheds.

I have been to a village known as Kawaski, accompanied by two fellow travellers—a great monthly *fête* was on, and the sight a very pretty and interesting one—especially in the Temple. On the road I saw the system of training fruit trees recently figured in the *Gardeners' Chronicle*. A flat trellis covering the entire orchard is laid on the heads of the trees—only a few feet high, and the branches tied to it. In the Temple—dedicated to Buddha—I bought a small medal of the figure, when a priest in return took us to a back court, and showed us a curiously trained Bamboo stem. The stem was tall and straight, and still growing, but between each node one side had been suppressed, and the other elongated (see fig. 56). A normal Bamboo has the nodes horizontal, forming a ring round the stem, whilst the one we saw had been made to grow, possibly by means of clay coverings, so that the nodes were oblique and directed alternately to the left and to the right; one side of each section is suppressed, and the other elongated and curved. The stem, quite straight, was some 8 feet high, with a small growing head. The garden was very pretty—little boats with sail set, made of Cherries and trained evergreens. Much Rice is cultivated round Yokohama, but I fancy in a different way to what is usual in the East—not from seed, but rather as a perennial. All one sees now are bunches of black stumps.

The private residences are prettily surrounded with Conifer hedges, and occasionally they possess small gardens. The hedges are chiefly Retinosporas, and sometimes Cryptomeria japonica, though I have seen several good ones of Citrus trifoliata, a Pinus, which I think there can be little doubt is densiflora, is also largely represented both wild and cultivated in porcelain jars trained into curious shapes.

The principal nursery is the Gardeners' Association, to which I think all the smaller nurserymen belong, and to which they send their things.

In the association grounds, were many Conifers, among which I recognised many old friends. The deciduous plants, Maples, Magnolias, Azaleas, &c., were only so many sticks at present. I saw, and have seen, with one exception, and that in a private garden, but few Abies. To the other nurseries I have only paid one visit each so far; they are very small places, containing usually mere trained, or rather deformed plants, in large porcelain jars than anything else. The plants most usually thus treated are Cherries, Plums, Retinosporas, and Pines. The first two named have often a very old stump several inches in diameter, and from 1 to 2 feet high, from which several young shoots, now clothed with buds, have been allowed to spring. The last two are dwarfed round specimens. Plant combinations, all growing, are also occasionally indulged in. Thus a small Cryptomeria, two or three shoots of Bamboo, and a sprig of Nandina domestica, now bearing its red seeds, may all be seen growing in a small jar. These combinations are a particular study, and I have purchased a book showing many such, and which I will send home when I leave Japan. Another plant much used for dwarfing is Podocarpus macrophyllus. A frequent sight is a specimen with a stem 2 to 2½ inches in diameter, and a perfectly formed pyramidal head some 18 inches high. A very common plant in the nurseries is Nandina domestica, now profusely bearing last season's red seeds; it sometimes grows from 6 to 7 feet high. A larger leaved variety, with pure white seeds, is also common, but its leaves lack the bronzy tinge of the true domestica.

Daphne odora is now splendidly in flower, compact oval bushes, 3 to 4 feet high, and as much through; in some instances they are covered with the reddish-white powerfully-scented blossoms, the white being also frequently represented. This plant is to be seen in the gardens of most private residences.

I have seen two fine trees of Magnolia Halleana one nearly 30 feet high, with a large round, evenly-shaped head, the tip of nearly every shoot—many hundreds in number—bearing a bud just emerging from the hirsute calyx. As these blossoms will all be open with not a leaf on the tree, it will be a remarkable sight. I came across the tree one afternoon on an embankment in a hedge bounding a private place on the very outskirts of the town, and have noted the place to return and see this tree in flower.

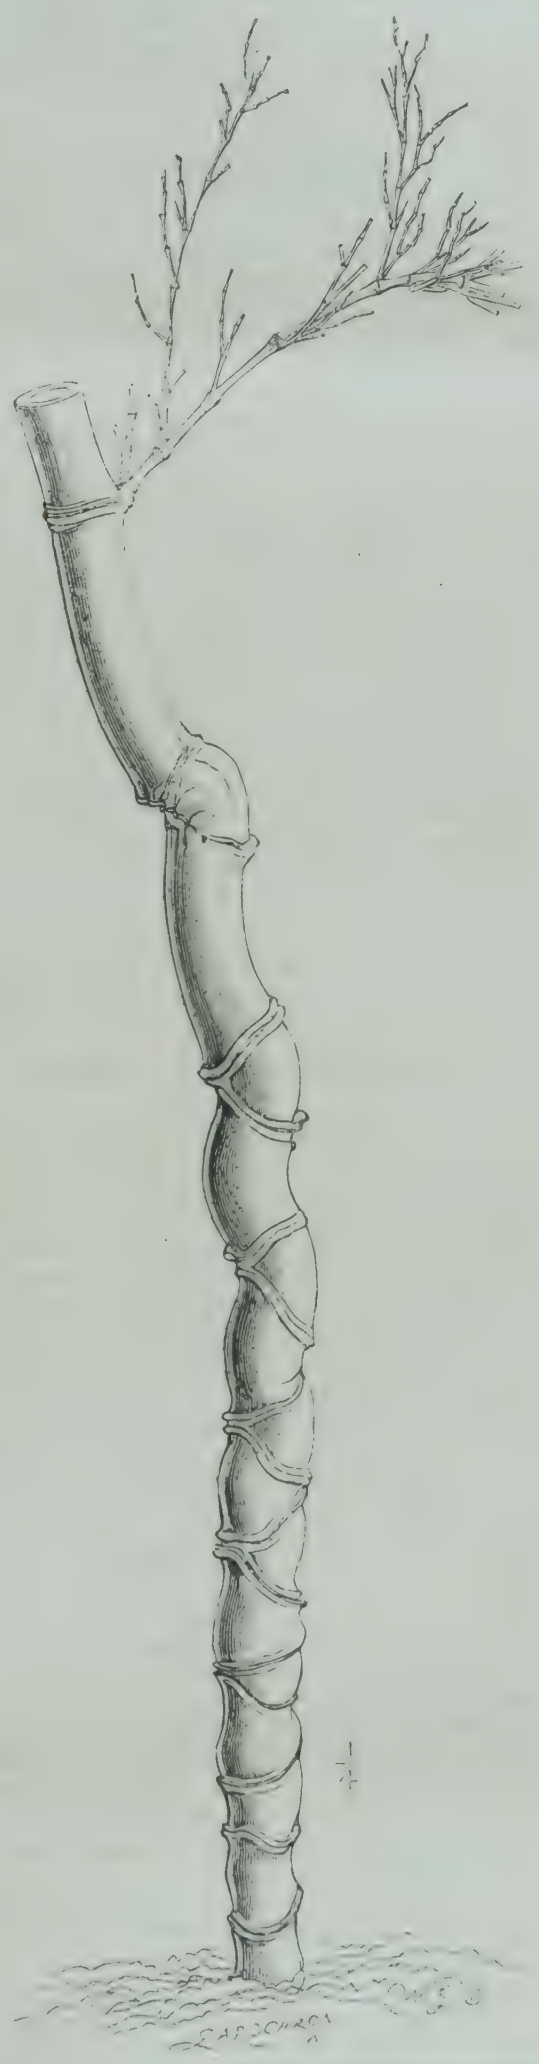

Fig. 56.—Artificially-distorted Bamboo, now in cultivation at Combe Wood.

One of the best private gardens in or near Yokohama belongs to a great silk merchant, by name Nozawaya. This garden is only thrown open to the public twice a year, but I managed to get in, and was well repaid. It is a large place, full of little hills, little forests, a little river, very little summer-houses, little paths, all covered with mats, about 2 feet wide, which wind round the little hills, and by little bridges over the little river. The whole big garden is little, and most curious; one cannot help smiling in going round. In this garden are clumps of Cherries, on short stems; from a little hill you look down on them, whilst a few yards' walk places you beneath them. A path with a Bamboo fence, 1½ feet high, runs round the clump, and leads to another little hill, covered with Pines, 2 to 3 feet high. Clumps of an Abies, which on examination I took to be firma (bifida), are opposite some Bamboos; whilst Retinospora, and some really fine trees (some 50 to 60 feet high) of Cryptomeria japonica were well represented—the only thing large in the garden (for I was a foot higher than anyone in the place). Here I saw many clumps of the yellow-edged Bamboo, the only place in which I have seen it so far; it here possesses the same peculiar characteristic as with us. This garden was very curious, but I believe that of the Prince at Tokio is still more so. To see this I shall require the Ministers' assistance. *James H. Veitch.*

(To be continued.)

VEGETABLES.

SEAKALE.

It is at this time of the year that the principal points of culture demand attention. Seakale, it may be safely said, is one of the most valuable winter vegetables, requiring but little care and trouble at that season of the year to produce fine heads when good stout and well-matured crowns are to be had, and to secure these no time should now be lost in getting the sets planted. Good strong and thoroughly enriched soil, fully exposed to the sun, and broken up to a fair depth, is one of the most important items to be considered; and if this is properly done, young pieces of the roots without eyes should be cut up in lengths of from 4 to 5 inches, dropping them into holes a couple of inches below the surface. These holes should be made with a dibber, in rows about 14 inches apart, always filling up with fine soil or coal-ashes. This plan I have found to answer the best, when the roots are intended for lifting and forcing; but for forcing under pots, they should be planted in clumps, according to the size of the pot. The beds should be gone over at intervals, and all the buds removed from each set, with the exception of one to form the crown for forcing; the beds should be kept free from weeds, and in very dry weather they should be thoroughly soaked with manure water. With such management extra fine plants may be had to force next autumn. In cold parts the pieces may be put thickly in boxes, and brought forward in a little warmth, which gives them a longer season of growth, but this is not required in the south. The roots should be tied up in bundles when lifting them up for forcing the tops, being cut straight across, and the bottom slantingly, so that there be no confusion when planting. The best and thickest should be kept to themselves, and the thinner ones for stock-raising. All those heads which have not been forced, and which are now pushing into growth, should be cut off a couple of inches under the ground, which will prevent them seeding, and then treated with regard to disbudding as above. *H. Markham.*

Chicory Witloof.

This estimable winter salad-plant has large, erect leaves, with white veins, but not indented at the edges, and the root and crown are much better formed than those of the ordinary Chicory. Sow the seeds in drills at the end of the present month, allowing 10 inches between the rows, and thin the plants to 5 inches apart. Keep the ground clean.

and water once or twice in rainy weather with manure-water. This is all the treatment required in its cultivation. In October or November select a dry and rather raised position in the garden; then open a trench about 30 inches deep by 15 inches in width, put in the bottom a thin layer of leaves or straw, and cover with 2 or 3 inches of light soil. Take the roots, cutting off the extremities of the longest, so that they should all be of about the same length. Place them in an upright position, with their heads close together, shaking in a little soil to fill up the crevices level with the crowns. Then cover the crowns with about 6 or 8 inches of sandy soil, after which cover with hot stable manure, according to quantity required. The warmth will speedily cause the roots to vegetate. By raising the manure slightly, one can see when the points begin to come through the soil. Then is the time to commence the cutting, which can be done by drawing away the soil with the hand, and cutting just below the crown. As the growth has received a certain pressure, the crown of leaves remains compacted, which gives it somewhat the appearance of the heart of a Cos Lettuce. In this manner an excellent vegetable can be obtained without much trouble or risk. It may be cooked whole and served with a sauce, or pulled to pieces and eaten raw.

The above is a French method, described in a recent number of the *Journal de la Société Regionale d'Horticulture du Nord de la France. W. E. G.*

CALIFORNIA.

Mr. W. Laing Malcolmson of Aberdeen, whose experiences as a fruit-grower in California we gave in our issue of March 11, sends us the following supplementary details:—I mentioned that I had known "many instances of men landing in California without any other capital than their own labour, and working themselves (with the aid of a wife) up to such a position as to be able, through their savings and economy, to own an orchard or a vineyard within a few years of their arrival." These instances (which I could enumerate in detail) are cases of men who had been brought up to field-work, and who within a few hours of their arrival in California could command immediate work at from £5 to £6 per month and their board; whilst, if they had a wife, she could command from £4 to £5 per month as a domestic servant. For the ordinary clerk, artisan, or mechanic, there is practically no work in California, as there are more labourers of this class in that State than there is work for.

From the correspondence I have received from those with a little money, and who, I think, would form splendid colonists, let me select a letter received a day or two ago; and in answering it, I will cover much of the ground of other inquiries which have and may be made of me. The writer says:—

1. "In what condition is the unbroken land?
2. "What can the waste land be bought for?
3. "What could land stocked with fruit trees, and bearing a fair return, be bought at?
4. "Could you advise a person (who has money) to buy a going orchard that has had no experience in fruit-growing?
5. "Would persons who have a young family and a few hundred pounds be successful settlers in California?"

I shall now answer for the benefit of your readers these questions as follows:—

1. "In what condition is the unbroken land?" The answer to this is, that generally the land in California suitable for fruit growing is level and of the richest description; no stones, shrubs, or trees; soil usually alluvial deposits, easily worked, and splendidly adapted for irrigation purposes.

2. "What can waste land be bought for?" Land suitable for fruit growing cannot be got for much less than £20 per acre, and may be as high as £50 per acre, according to situation and other facilities, although there might not be probably much difference in the quality of the land itself.

3. "What could land stocked with fruit trees, and bearing a fair return, be bought at?" This depends on the position of the property, its improvements, and its age; also the class of orchard. Orange groves bearing a net annual return of £200 per acre would, in proportion, be more than a young orchard or vineyard only a few years old; this question is difficult to answer.

4. "Could you advise a person to buy a going orchard that has had no experience of fruit growing?" Hundreds come out to California who have money, and rather than wait until an orchard comes into bearing, purchase an orchard or vineyard right out, and derive a handsome return from their investment. It is not necessary to have any experience in fruit-growing, as experienced help or assistance can be easily procured.

5. "Would persons who have a young family and a few hundred pounds be successful settlers in California?" There is only one answer to this. Most decidedly, yes.

I should like to mention also that I know of a property in California, situated in, perhaps, the best position of the State, known as Chino. The owner of this property, Mr. Richard Gird, has had lately erected on his property—which extends to some 55,000 acres—one of the largest sugar beet factories in the world. The settler on this property can, after he has planted his orchard, utilise the space between his trees for Beet growing, so that he can commence earning a return from his orchard, say, £6 to £8 per acre, within six months from his taking up the land, and this advantage cannot be attained in any other portion of California.

Mr. Malcolmson's address is 102, Union Grove, Aberdeen, and he will be happy to answer all enquiries addressed to him regarding California.

The Week's Work.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

STOVE FLOWERING PLANTS.—Plants of Allamandas, Clerodendrons, Ixoras, Rondeletias, &c., that are required for flowering during the autumn months, and have been kept back for that purpose, should now be pruned in, repotted, and started into growth. Those that were started in January for early summer flowering are now growing apace, and will require vigorous treatment to bring them to condition at that time. Pay careful attention to the watering of specimen plants when they require it, and give thorough soakings of well-diluted liquid-manure. Keep up a brisk temperature of from 65° to 85°, and syringe twice daily. Stephanotis, Gardenias, Posoquerias, and Pergularias, that are growing freely, will take good waterings of weak liquid-manure and frequent syringings during bright weather, also a little shade from bright sunshine, but not very much till the days are longer. Rondeletias, Clerodendrons, Allamandas, and Bougainvilleas will do best placed in a situation where they will get plenty of air and light to make them strong. Attend to the training of these, but do not tie them down too soon; it is better done when the growth is a little matured.

Aphelandra cristata should now be pruned in, and started to grow. Strike cuttings, if required, in bottom-heat, and repot old plants in good loam, peat, and sand.

Clerodendron fallax and *C. fragrans pleniflorum* may now be cut back, and started afresh. The latter variety is worth growing for its delicious perfume. For soil, use peat and loam, with a little rich manure. Water well when growing, and place in the lighest part of the stove.

The Honey Plant, Hoya carnosa, and the smaller growing varieties of Hoyas, will want attention. H. carnosa will grow and flower for many years in a large pot, trained to a wire trellis, or planted in a border, and trained to the roof of stove, or against a wall. They like plenty of heat and light, a good rough open soil of peat, loam, and sand, with broken slate and charcoal, and good drainage, not much water during the winter, but a plentiful supply during the summer. The smaller varieties, H. bella and H. Paxtoni, are suitable for smaller pots or baskets.

Hibiscus.—The double and single varieties are worth growing in 6 and 8-inch pots to place about for decorative purposes. Cut back old plants, let them break, then shake out the old soil and repot into loam, leaf mould, peat, and sand. Also strike cuttings in peat and sand.

Pancratiums are among the most useful of stove-flowering plants for decorative or cutting purposes. They like a large well-drained pot, good loam, leaf mould, and plenty of sand; they will grow for many years in the same pot with good top-dressings. They like abundance of heat when growing, but when in flower they will stand for a long time in a cool house or room.

Passion-Flowers.—Where there is available space, the stove varieties of these should always find a place. They require plenty of room both for roots and branches, and grow well in a light rich soil of peat, loam, and sand, with good drainage. The shoots should not be allowed to become too crowded on the plants. The following are good varieties—P. amabilis, P. Buonopartea, P. edulis, P. princeps, and P. quadrangularis.

Thyrsacanthus rutilans.—This is a very useful plant, grown in 4 or 5-inch pots, for table or house decoration. It should be grown in leaf-mould, turfy loam, sand, and a good portion of broken crocks, shells, and small charcoal, with careful attention to drainage and top-dressing. It will grow for several years in a small pot, and is easily increased by cuttings.

Vinca rosea and V. r. alba.—These grow well in turfy loam and leaf-mould, some dry cow-dung, and plenty of sand. Prune and repot old plants that require it. Cuttings taken from the young shoots will strike well at the present time, and soon make good plants. They are all very showy, free-flowering plants, and easy to cultivate.

FRUITS UNDER GLASS.

By M. Temple, *Gardener, Carron House, Stirlingshire.*

VINES.—Those which are intended for early crop must have careful attention in regard to watering inside borders, and those outside should be kept covered by boards, tiles, or thatch, to throw off rain. If red-spider should appear, sponge the affected foliage with a weak solution of Gishurst Compound, keeping the bunches free from touch from the liquid. The foliage must not be crowded, and stop young growths before they are large enough to cause a check by removal—this is one of the reasons for shanking. When colouring begins, give air freely, with a gentle heat in the pipes, but much front air must be avoided during cold winds. Muscats and other shy setters should have extra warmth and rather dry air until they are set; shake the bunches or touch the pistil with a camel's-hair brush at mid-day, to circulate the pollen. A little ventilation during warm nights will aid setting; a heat of 75° by fire, with 10° increase with sun, need not be exceeded. Examine the late crops, and remove all shoots not required, but see that enough bunches are left; those nearest the rods are generally the most compact and best formed, but not always so large as those further from the Vine. To ensure a crop upon shy-fruiting varieties, well-selected shoots, made from each side of the Vine, about 4 feet apart, may be trained out to supply fruit next year. This is more certain than the long-spur system, and not so unsightly. All surfaces not cleared and renewed with fresh soil should have prompt attention, without disturbing the roots. Do not exceed 70° with fire.

ORCHARD-HOUSE.—Care is very necessary at this season with trees in pots. Apricots will be set, or setting, and they require much air, but cold, frosty winds must be avoided. Peaches, Cherries, Pears, and Plums, coming into flower, must not be unduly excited, and watering should be done by judicious hands. The atmosphere may be kept rather dry till the fruits are set, and give the shoots a gentle tap in the middle of the day to assist in the distribution of the pollen. If aphis appear, dust with tobacco-powder; but where trees are not in flower, they may be fumigated with tobacco, or tobacco-paper, which should be continued the following day. Use no liquid manure until the fruits are set, and do not allow the temperature to rise above 55° in absence of sunheat.

FIGS.—Trees in a growing and fruiting condition require much water, and to those in pots liquid manure may be given at every alternate watering. Syringing may be freely done when shutting up on warm afternoons, and the water used should be of the same temperature as the house, which may run from 60° to 70° without sun. Stop shoots at fourth leaf; on the long-shoot system enough young wood may be

trained-in for future supplies of fruit. Crowding means failure. Trees for late crops should move slowly; fluctuation of temperature is apt to cause the fruit to drop.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

GENERAL REMARKS.—The mild weather we have had during the last two months or so has been all that an Orchid-grower could desire. With the absence of cold winds more or less air has been admitted both night and day. This has kept them sweet and free from the evils arising from stagnant atmosphere. Our bottom ventilators are seldom closed, unless it be a few hours in the early morning, when the night has been colder than was expected when banking up the fires. Any Dendrobium required to flower in May must still be kept in a cool, airy, and shady house at about 50°, but the bright sun we are now having will make it more difficult to keep them back. Do not let them suffer for want of water, or the buds will not be fine. Cattleya labiata vera and C. Bowringiana having been carefully rested as advised in previous Calendars, will now be starting into new growth. Keep a good look-out at night for snails, woodlice, and cockroaches, as they are very destructive to the tips of the roots, when they make their appearance from the base of last year's pseudobulbs. Give more water both at the root and in the atmosphere, also a few degrees higher temperature. Any Cattleya Trianæ, or C. Percivaliana, which have finished flowering, and need potting or top-dressing, should be treated at once, and as they are now swelling their new growth, a little more water will be required to keep them from shrivelling. Odontoglossum Roezlii and O. Phalænopsis, having been wintered as advised, will now be flowering freely, and must not be neglected. They may be syringed twice a day, and given plenty of water at the root. This will tend to keep down thrips and green-fly. O. Phalænopsis, having been grown in the stove during the winter months, should now be taken back to the intermediate-house, where it will flower freely. Water and syringe Miltonia vexillaria freely once or twice a day, according to the weather, well damping the stages, paths, &c. Ada aurantiaca should be coming nicely into flower by this date, if it is in a healthy condition, and has received proper treatment. This is a grand Orchid to arrange in a house with Odontoglossum crispum, Masdevallia Veitchii and M. ignea, O. Pescatorei, &c. Lælia anceps and Cœlogyne cristata, having finished flowering, they must now receive a good supply of water at the roots and in the atmosphere. Where these Cœlogynes are grown in quantity for cut flowers, the variety C. cristata Trentham and C. c. alba should be grown. C. cristata has finished flowering three weeks ago, but the varieties Trentham and alba are just at their best, and will be good for cutting until Easter. Any Cœlogynes that need potting or breaking up to increase the stock may be treated now. A good compost for potting is peat, loam, sphagnum moss, broken crocks, and silver sand. The Lælia anceps are making new roots fast, and must be well looked after, that they are not eaten off. L. anceps, L. autumnalis, L. albida will all take copious supplies of water, after being kept quite dry during winter. We have just potted our Thunias Bensoniæ and Marshalliana in compost of equal parts peat, loam, and moss, with a good sprinkling of broken crocks and silver-sand well mixed, filling the pots three-parts full of clean crocks, and making each bulb secure. They have been started into growth about a month, and have made growth an inch or so long, with new roots, which take to the new compost at once, and soon fill the pots. We used 10-inch pots, placing ten plants in each.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

GENERAL WORK.—All shrubberies should now receive a good hoeing, removing any dead branches that have been killed by the frost, and if the work of cutting back and thinning has been neglected till this date, the work should be brought to a speedy completion. In trimming the edgings of turf, be careful not to cut the beds or walks out of shape, nor to reduce the surface of the turf. Place the line along the margin, beat the edge out if it requires it, and then cut off any part which is out of proper bounds. Where the edging has been unduly cut along gravel paths, the earthy margin may be taken away, and a quantity of gas-lime strewn along, and the gravel made firm over it, thus causing worms and weeds to be less troublesome. The regravelling of walks should be finished as early as possible. In the case of old gravel paths that are weedy and mossy, they should have a good sprinkling of waste salt, and if applied during fine sunny weather at this season of the year it cleanses them, and brings into prominence the colour of the gravel, beside killing many seedling weeds now about to become visible. All lawns should have a thorough good rolling and sweeping preparatory to the use of the scythe or mowing machine. The preparation of beds for Stocks, Asters, Dahlias, and other summer flowers that require good rich soil, should now be done. It is not advisable to use much, if any, manure in the beds that are to be occupied by Pelargoniums, unless dug in very deep, so as to be out of the reach of the roots until later in the summer, when the plants are properly established. The florist-seedling varieties of Gladioli should now be planted about 3 inches deep, and unless the soil is of a dry sandy nature, drop a little sand in the bottom of the holes, as excessive moisture after being kept dry so long is apt to cause them to rot. If very late blooms are required, plant them in shallow boxes of rich soil, and keep them in a cool shady situation for a time.

HERBACEOUS PHLOXES, ASTERS, ETC.—These plants are forming strong young growths abundantly, and it is a good plan to thin them out, leaving the strongest for flowering. The cuttings taken off, if dibbled into pots of sandy soil, and placed under glass slightly shaded, will root very readily, and make useful plants for the border or wherever required next autumn or spring. All hardy plants that have been wintered in pots should be planted without delay, and if the ordinary soil is not rich enough for any particular plant, make holes, and fill in with good soil suitable to the plant. The plants may be arranged in groups of three or five, and should be placed about 1 foot apart, according to their growth and strength. The best way to plant such plants as Canterbury Bells, Aquilegias, &c., is to put them singly into the border at intervals, as they then have greater effect than when in groups. All bulbs of Hyacinths, Tulips, Narcissi, that have been forced may be planted in spare places. They will come in useful next season to brighten up odd corners, as well as for cut-flower purposes. The forced clumps of the old, beautiful, and very useful Dielytra spectabilis, if gradually hardened-off, and planted in good rich moist soil, will make strong clumps for forcing in about two years hence.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

AMERICAN BLIGHT.—Trees which have been infested with this troublesome pest should be carefully examined, and where there are any signs of its reappearing, advantage should be taken of every opportunity before the trees come into bloom to kill the same. We have found the "Stott Patent Syringe" of much use in this matter, as a number of trees can be gone over in a short time. To do the same with a painter's brush took so long that at this busy season the matter too often was neglected, and so the pest got established again early in the season. Any favourite remedy, as "Killmright," and Bentley's Insecticide, or Gishurst Compound, with which is used a wineglassful of petroleum to every 3 galls. of the mixture, can be used, and it should be kept well mixed together as directed in former Calendars. For the benefit of those not acquainted with the above syringe, I may state that it is provided with a nozzle with which any part of a branch can be got at, and it can be used with such force as to dislodge any insects. If sufficient courage could be commanded to destroy any young tree or trees bought in from nurseries directly the above blight is observed, and procure the desired kind or kinds from another source, it would save much after trouble, and would result in the possession of more healthy trees.

GENERAL REMARKS.—In dry weather, keep the hoe well at work among Strawberries, this being important, as the time is now approaching for placing litter amongst them, before which the ground ought to be quite free from weeds. All late-planted fruit trees, including Raspberries, should now be pruned, and afterwards staked and mulched. The best mulching is spent hot-bed manure, that portion procured from the middle of the bed which has not become too much rotted. Push on with grafting, as directed in former Calendar, as quickly as possible, as the season being exceptionally early, the sooner it is finished the better, thus affording a longer season for the scions to mature their growth.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

GENERAL WORK.—No better weather could be had for getting on with the work than that experienced during March in this district. The sun's heat, together with the accompanying drying winds, have reduced the soil into good working condition, so that it will not be difficult to sow any kind of seeds still remaining unsown. Advantage should be taken of such weather to run the hoe through all growing crops, to keep down weeds. Where any digging remains to be done, push forward with the work without delay. Cabbage that was planted in the autumn will be greatly benefited by a dressing of nitrate of soda between the rows.

ONIONS.—Where those sown in the autumn still remain in the seed-bed, they should be thinned. Such varieties as The Queen should be allowed to stand 4 inches apart. We find this one of the best for sowing in the autumn, as it turns in quickly, being ready for use long before any other kind. The thinnings may be transplanted, if required, as they will give a succession. Those that were sown in heat, and have been growing in hot-beds, may be transferred to the open ground, for it is better that they should be transplanted before they have grown too large, especially if the weather be showery. The distance allowed between these must greatly depend on the variety, and the purpose for which they are intended.

SMALL SEEDS.—Brussels Sprouts, Savoys, and Borecole — make a sowing of these in the open ground. Here, we seldom sow such things before the first week in April, except for the purpose of getting a few early plants. For if the ground be well tilled and the plants properly attended to, Sprouts from the April-sowing will be ready when required. We prefer sowing the seed thinly in drills about 6 inches apart, as by this means a hoe can be run between the rows to keep down the weeds. This also prevents any necessity for pricking off the plants; for if overcrowded, they become weakly, and seldom give satisfaction. Large Sprouts are not desirable unless for special purposes, therefore, compact growth should be the aim.

LETTUCE.—Those that were raised in hot-beds may now be planted out, choosing a dull showery day for the purpose, if possible. If not, the work should be done towards evening, so that the plants do not flag before being watered. In lifting them, preserve all the roots possible, for it will save much time if they are taken with a ball containing the fibrous roots. It is much the best plan to plant such things with a trowel on heavy land, for a dibber presses the sides of the hole, so that the tender roots cannot penetrate the soil.

BROAD BEANS.—This is not a vegetable in general demand for gentlemen's tables, so that only those of the best colour and finest flavour should be grown for that end, and as the Green Windsor possesses both these qualities, it is the most suitable. For a succession it is as well to make another sowing as the former one appears above the soil.

GLOBE ARTICHOKES.—Plants in pots that have been protected in frames may now be planted out. If planted singly, 3 feet apart each way should be allowed, but if in clumps of three, 4 feet between the clumps will not be found too great, as they will make rapid growth if the ground be in good heart.

SHALLOTS.—The soil should be removed from round these to the base of the bulbs, and if the ground be at all heavy, give a slight sprinkling of sulphate of ammonia between the rows. But if the land be light, and contain a quantity of lime, then nitrate of soda should be given in preference. Do not let either of these stimulants come in contact with the foliage, or they will burn it. Garlic may be treated similarly.

LEEKS that were started in pans or on hot-beds should be transplanted when large enough. In order to get good bulbs early, it is necessary to bring the plants forward by artificial means; but should they be subjected to a severe check, they will run to seed.

EDITORIAL NOTICES.

Letters for Publication.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.*

Plants, &c., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Illustrations.—*Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

THURSDAY, April 6—Linnean Society.
FRIDAY, April 7—Dundee Horticultural Association.
SATURDAY, April 8—Royal Botanic Society.

SHOWS.

WEDNESDAY, April 5 { Royal Caledonian Horticultural (two days). Birmingham Spring Flower Show (two days).

SALES.

THURSDAY, April 6 { Plants, Roses, and Hardy Bulbs at Protheroe & Morris' Rooms.
FRIDAY, April 7 { Imported Orchids at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—44°.8.

Horticultural Examinations.

We are requested to publish the following letter relating to the examinations proposed to be held by the Royal Horticultural Society in May next. Presumably, the examinations will be conducted on the same general lines as were followed last year, when the examiners were informed before setting their questions as to what opportunities had been afforded to the candidates to gain the desired information. For the most part, the candidates had only attended the very short courses of practical lectures and demonstrations given by the instructors appointed by the several County Councils. The information given by these gentlemen was for the most part strictly practical. Considering the circumstances of the case, and the tentative character of the whole matter, no other course was open, and probably it will be found that this year the conditions have not greatly altered. The scheme by no means fulfils the ideal, but it is the only one that can be adopted at present. An ideal scheme cannot be translated into practice forthwith. It must grow, or in the language of the day, it must be evolved. Practical instruction is indeed necessary, and for the class of men who attend these lectures, considering the very limited time at their disposal and the special requirements of the case, it is difficult, if not impossible, to devise a better method. Nevertheless, the one great requisite in modern horticulture is a better understanding of general principles and their application to practice. Practical horticulture can only be learnt in the garden, but there under present conditions routine only can be taught. No doubt, a very high degree of proficiency is attained, but if it be not leavened with intelligence and knowledge of principles, progress and adaptation to new circumstances can hardly be expected. We do not want our young men merely to be as good as their fathers, we want them to be better, or in any case better equipped to meet the altered circumstances of the time than their predecessors could possibly be. An examination such as now proposed cannot make a gardener, nor can success in it be taken as evidence that the examinee is a competent gardener. All that it can do is to indicate broadly what are the most important subjects to be studied and to afford some guarantee of intelligence, some evidence that the pupil has profited by what he has heard and read, and some reasonable forecast that he is on the right road to become a well-trained and intelligent gardener.

"Royal Horticultural Society,
"117, Victoria Street, S.W.
"March 23, 1893.

"I trust that the importance of the subject may be my excuse for troubling you. Our Society, in compliance with numerous requests from county councils, directors of technical institutes, lecturers, and others, is going to hold an examination in the elementary principles, and in the practice of horticulture. The date fixed for the examination is Thursday, May 4.

"Being anxious that everyone in the United Kingdom who desires to sit for such examination, may have the opportunity of so doing without unreasonable difficulty, we are prepared to institute such examination in any village or town in the kingdom where any magistrate, or clergyman, or schoolmaster, or other responsible person accustomed to the conduct of examinations will undertake to act as our representative, and see that our rules are strictly observed, and that no copying or consulting of books, &c., takes place. Anyone, therefore, wishing to sit for such examination can do so close to his own house, if he will, by the end of the first week in April, put me in communication with any such responsible person who is willing to act as our supervisor of the examination. Obviously, we must leave this part of the work to the candidates themselves, as we cannot know the names of suitable and willing persons in every village and town in the country.

"Three scholarships of £26 a year, tenable for two years, are offered in connection with the examination; and I am already in correspondence with a very large number of persons in all parts of the country with reference to it.

"A fee of 3*s*., payable in advance, will be charged to all persons entering for the examination, and all letters on the subject requiring an answer, should contain a stamped and directed envelope. I need hardly say that the fee of 3*s*. will not nearly cover the necessary expense of the examination, which will, therefore, entail considerable loss on the Society's general funds, but the council are of opinion that by putting the fee as low as possible they are promoting the best interests of horticulture, and they trust that their action will commend itself to all lovers of gardens. The entrance fee should in all cases be sent to me before the date of examination. *W. Wilks, Secretary, Royal Horticultural Society.*"

The Linnean Society of London.—An evening meeting will be held on Thursday, April 6, at 8 p.m., when the following papers will be read:—1. "On a Collection of Plants from the Region of Lhassa, made by Surg.-Capt. W. G. Thorold in 1891; and a further collection from the Kuen-Lun Plains, made by Capt. H. P. Picot in 1892," by W. Botting Hemsley, F.R.S. 2. "Subterranean Crustacea of New Zealand," by Chas. Chilton, F.L.S. 3. "Various Marine Animals, mounted as transparent Lantern Slides," exhibited and described by Dr. H. C. Sorby, F.R.S.

Tadcaster Paxton Society.—On March 23 the members held their first annual meeting, for the election of officers and for hearing the first report. Although in its infancy, there are already fifty-seven members, and the Society is doing some useful work. During the year thirty-seven papers have been read, the greater part of which have dealt with practical horticulture. An illustrated lecture by Mr. Callum, B.A., on "Chemistry of Soils," was greatly appreciated.

Gardening and Forestry Exhibition at Earls' Court.—The following are the dates of the flower shows to be held in connection with the above exhibition:—May 13, opening day, special flower show; May 18 and 19, Orchids, &c.; June 28, early Rose show, &c.; July 12, late Rose show, &c.; July 26 and 27, Begonias, Carnations, Picotees, &c.; August 9 and 10, flowering and foliage plants, &c.; August 23 and 24, Gladioli, Dahlias, &c.; September 13 and 14, autumn flowers, &c.; September 27, 28, and 29, great show of hardy fruit, &c. In order to encourage high class culture in plants, flowers, fruits, &c., a limited number of valuable Gold Medals will be awarded to exhibits deemed so worthy by the judges appointed to adjudicate on their merits. It is not necessary that such exhibits be displayed at the competitive shows; they may be arranged at intermediate dates.

Scent of Orchids.—In the *Comptes Rendus de l'Académie des Sciences* for March 6, there is a paper by M. Eugène Mesnard on the "Perfume of Orchids," detailing the results of experiments made in the botanical laboratory of the Sorbonne. The author sums up his notes in these terms:—"The flowers of scented Orchids have no peculiar anatomical structure, rendering them markedly different from other flowers which emit perfume. The essence is usually found in the epidermal-cells of the inner-surface of the petals or sepals. Nevertheless, in flowers which contain in their cells a sufficiently large quantity of fatty oil and vegetable-sugar, there is also perfume essence in the cells of the outer-surface of the same parts. If the relative importance of the cellular contents, and the larger or smaller proportion of tannin compounds in the flowers of Orchids be remembered, this will explain some of the remarkable peculiarities discovered in the mode of production of the perfume, such as the modifications in the intensity, and even in the character of the perfume at different periods of the day, principally in the morning and evening."

The Floods in Queensland.—The *Daily Graphic* of March 29, has an illustration, showing a large steamer stranded in the Botanic Garden at Brisbane, and the Bunya-Bunya trees (Araucaria Bidwillii).

Beckenham Horticultural Society.—The Committee of this excellent suburban society having arranged for a course of six lectures, to be given to the members at the Public Hall, the two first were given by Mr. A. Dean, of Kingston, on March 17, on "The Potato;" and on the 24th on "The Tomato." At the first lecture the Rector of Beckenham presided, and at the second Dr. Kirby. This latter gentleman challenged all present to indicate a longer knowledge with the Tomato than he possessed, having met with it in great abundance forty-five years ago in Corfu, although then the samples were poor indeed as compared with the splendid fruits found to-day. The lecturer covered wide ground in connection with the Tomato, referring to its gradual development in quality, its popularity as a food product, its encouragement at exhibitions, though strongly advocating that prizes be given for clusters of fruits rather than for a few large fruits, which

were not so useful, or indicative of cropping qualities, as were good clusters. Very cordial votes of thanks were given at the close of each lecture. Some capitally-flowered Amaryllis were exhibited by Mr. Beck, gr. to Mr. W. Stevens. Very beautiful cut Tea Roses, The Bride, Catherine Mermet, Annie Hoste, &c., were shown by Mr. Crosswell, gr. to Mr. W. H. Bullivant; and a bunch of the charming Staphylea colchica came from Mr. Webster, gr. to Dr. Kirby. Other subjects of lectures are "Bees and Bee-keeping," "Violets," "Chrysanthemums," the latter by Mr. H. J. Jones. The attendances are large, and much interest is taken in the lectures.

THE NATIVE BIRDS OF NEW ZEALAND.—At a recent meeting of the Royal Geographical Society, the Council announced that they had passed the following resolutions relative to the protection of native birds in New Zealand: "The Council of this Society have learnt with great satisfaction the steps that were proposed to be taken by the Earl of ONSLOW, when Governor of New Zealand, and by the Houses of General Assembly, for the preservation of the native birds of New Zealand, by reserving certain small islands suitable for the purpose, and by affording the birds special protection on these islands. The Council much regret to hear that difficulties have been encountered in carrying out this plan as regards one of these islands (Little Barrier Island), and trust that the Government of New Zealand may be induced to take the necessary steps to overcome these difficulties, and to carry out this excellent scheme in its entirety. The Council venture to suggest that besides the native birds to be protected in these reserves, shelter should also be afforded to the remarkable Saurian, the Tuatera Lizard (Sphenodon punctatus), which is at present restricted to some small islands on the north coast of New Zealand, in the Bay of Plenty." It will be remembered by our readers that a brief description of Barrier Island from the pen of Mr. HUGH BOSCAWEN was given in a recent number.

BANGALORE.—From the official report on the government botanical gardens and parks of Mysore, we learn that Mr. JOHN HORNE STEPHEN has been appointed curator of the garden. With a view to the supply of practical gardeners, a course of training has been laid down and scholarships instituted. The following is the syllabus of practical work to be taught to the apprentice-gardeners during a three years' course of training in the botanical gardens:—*First year.*—Two apprentices in flower garden for four months—culture of flowers; Two apprentices in fruit garden for four months—culture of fruits; Two apprentices in vegetable garden for four months—culture of vegetables. The boys will alternate in pairs from one department to the other, and thus complete their course for the whole year. *Second year.*—Two apprentices in the propagating and potting department for four months; Two apprentices in Rose garden and attending to florists' flowers in pots, four months; Two apprentices in fernery, and attending to fine foliage and bulbous plants in pots, four months. *Third year.*—Two apprentices engaged in rotation of crops and season for cropping, &c., four months; Two apprentices in cultivation of special crops, such as cotton, tobacco, coffee, &c., four months; Two apprentices in collecting, storing, and preserving seeds. Also taking final lessons in tree planting, artistic gardening, and making up bouquets, &c.

CŒLOGYNE SANDERÆ.—A correction. By an oversight, the beautiful Orchid figured at p. 361,

FIG. 57.—VIEW OF BARN ELMS, BARNES, SURREY. (SEE P. 392.)

fig. 52, was called in the legend beneath the cut C. Sanderiana, though in the text, p. 360, the name was rightly spelt Sanderæ. It is most unfortunate that there should be two different plants of the same genus with names so nearly alike. C. Sanderiana was described in the *Gardeners' Chronicle*, June 11, 1887, by Prof. Reichenbach. C. Sanderæ was published by Dr. Kränzlin in the last number of *Reichenbachia*, t. 56, which had not reached us when our woodcut was published, or we should of course have mentioned the name of the author. Objection also is properly taken to the description "deep purple," as applied to the lip in the legend, and to the use of the word "maroon" in the context. Rolfe, in *Reichenbachia*, *l. c.*, says, "disc of the lip deep orange in front, much paler behind, and with three parallel keels, covered with long dark hairs." Mr. Moon's drawing shows their colour to be brownish-crimson. Others say, the hairs are simply brown. In any case, deep purple is incorrect.

Hartlepools Gardeners' Society.—This Society has been recently established to promote a better knowledge of horticulture among the gardeners of the district, by means of mutual help. The first essay was one on "The Potato," by Mr. J. Wood; then Mr. S. A. Taylor, gr. to Mr. C. Brown, Woodlands, gave an essay upon the Vine, entitled "Extention *v.* Restriction," the lecturer favouring the extension system. The last lecture was one upon "The Fuchsia," by Mr. J. Hall, gr. to Alderman Pyman, The Willows.

Lee, Blackheath, and Lewisham Horticultural Society. — The last of the winter evenings in connection with the Lee, Blackheath, and Lewisham Horticultural Society, was held at the Institute, Lee, on Friday evening last, there being a good attendance to hear a paper entitled, "Begonias and their Culture," by Mr. J. Laing, which, through the illness of that gentleman, was read by Mr. Hunt, his Begonia grower, who answered any questions that arose in debate. The chairman, at the close of the proceedings, complimented the Society upon having had better attendances and discussions during the last six months, and he hoped to see even better results next season. Mr. Judge, gardener to J. C. Geiselbrecht, Esq., of Eltham Road, Lee, was awarded a First-class Certificate for a magnificent seedling Cliveia, Beechdale; the two trusses contained seventy-six blooms of a deep orange tint.

Testimonial to Mr. Robert Smith.—To commemorate the appointment of Mr. Smith, late head gardener at Kenward, Yalding, in Kent, to the position of horticultural lecturer to the county of Salop, he has been presented by his numerous Kentish friends with a handsome dressing-case, and other articles. This testimonial, too, is intended to exhibit the appreciation shown by the supporters of cottage gardeners' societies of Mr. Smith's valuable labours in their popularisation and extension.

Devon and Exeter Gardeners' Association.—At the usual fortnightly meeting of the Association, held on the 21st ult., a paper on "Roses" was read by Mr. W. Connett, Rose grower to the Messrs. Veitch at the Exeter Nurseries. Mr. Connett's paper dealt with the subject in an efficient and exhaustive manner, and gave rise to considerable discussion as to the best time to prune, and many cultural details.

Natural Grafting of Rhubarb Leaves.—Mr. T. Brown, of Carlisle, has sent us a very singular instance of the adhesion of the blades of two Rhubarb leaves from opposite sides of the stock, the two leaf-stalks being separate, so that the section of the leaf might be thus represented λ. Although the two petioles are perfectly separate, the blade is quite simple, and presents no trace of its dual origin.

Royal Visit to the Quinquennial Exposition at Ghent.—The Administrative Council of the Société Royale d'Agriculture et de Botanique of Ghent have received official intimation that the royal visit to the Exposition will be paid on Tuesday, April 18, next.

Mr. Moon.—We are sorry to announce a serious misfortune which has befallen this well-known floral artist. Some pictures of his, on their way to the Royal Academy, were swept off the platform by a passing express train, and were of course destroyed.

Procession in Brussels symbolising Agriculture and Horticulture.—The Belgian capital has organised for the Fêtes Nationales, to be held in July, a procession of eleven cars of costume groups and musicians. The arrangement of the cars will be designed by special commissions, and submitted for the approval of the Commission of the Fêtes Nationales. The procession should prove an exceedingly interesting one.

BARN ELMS, BARNES, SURREY.

The Manor of Barn Elms was given by Athelstane (925–940) to the canons of St. Paul's, and has been held by them ever since, with the exception of its temporary alienation in the time of Cromwell. The name, according to Lysons, is the Saxon *berne*, a barn, and it has been suggested the canons may have had a *spicarium*, or great barn, here, but others think that barn was the patronymic of a family or tribe, as in Barnsbury, &c., and no doubt the parish of Barnes takes its name from the same origin.

In the taxation of Pope Nicholas, about 1291, the manor was valued as the property of the canons at £12. In the reign of Edward II., the canons obtained from the king a charter of free warren, and an exemption of the burthensome charge of purveyance.

From the Patent Rolls of the tenth year of Henry IV. (1409), it appears that the Archbishop of Canterbury was entitled to a sparrow-hawk (espervirium), or 2*s.* in money annually, and also £2 every twentieth year, for ever, from the lords of the manor of Barnes, belonging to the canons of St. Paul's, that they might be excused from serving from the office of reeve in his manor of Wimbledon. Barn Elms, like most estates belonging to ecclesiastical bodies, has been generally let on lease for long terms.

In the fifteenth century, the manor was again leased to laymen, for in 1467 (temp. Edward IV.) Sir John Saye and others were lessees of the manor, which they held with the advowson, and presented to the living in that year, and again in 1471 and 1477.

In 1579 it was held by Richard Martin, Alderman of London; in the same year he sold his interest to Queen Elizabeth, who bought it for Sir Francis Walsingham and his heirs for ever, as a reward for good services rendered to the Crown. Sir Francis entertained the Queen in 1585, 1588, and 1589. On the last of these visits Lord Talbot, who was appointed to attend the Queen at Barn Elms, wrote to his father, the Earl of Shrewsbury, May 26, 1589, as follows:—

"This day Her Majestie goeth to Barn Elms, where she is] purposed to tarry all day to-morrow, being Tuesday, and Wednesday to return to Whitehall agayne. I am appointed among the rest to attend Her Majestie to Barn Elms. I pray God my diligent attendance here may procure me a gracious answer to my suit at her return, for while she is ther, nothing may be moved but matter of delyghte, and to content her, which is the only cause of her going thither."

Barn Elms is now tenanted by the Ranelagh Club. The grounds, some 100 acres in extent, having at points pretty views of the Thames, contain some very fine examples of tree growth. Planes are especially fine. As was recently noted in these columns, P. orientalis is particularly noteworthy, having attained a height of 100 feet, with a girth of 20 feet at 4 feet 6 inches from the ground. There is a good avenue also of Planes, the trees of which have been "pollarded" down. Many Cedars of Lebanon are scattered about, one a stately specimen, is about 80 feet in height, the branches giving a spread of 30 yards. Elms, too, are conspicuous features. The Beeches and Oaks have attained large dimensions, and add considerably to the attractions of the place. Gerard mentions planting a Phillyrea in the gardens of Barn Elms, which at that time belonged to the Earl of Essex.

The famous Kit Kat Club was once established here, and in the old rooms of the club may be seen the portraits of its thirty-nine members, all men of the first rank and learning, most of whom were at times employed in the highest State offices or in the army. [A series of Kit Kat portraits is also in the possession of Mr. Baker, of Bayfordbury, Herts. Ed.]

I am indebted to Mr. C. J. Barrett and to Mr. M. Mitchell respectively, Secretary and Steward of the Ranelagh Club, for information respecting Barn Elms, the grounds of which are well managed by Mr. J. Wheeler. *J. B.*

THE GOOSEBERRY CATERPILLAR.

(See fig. 58, p. 393.)

It unfortunately happens that most of our choicest fruits have formidable and troublesome enemies in the form of fungus, insects, or birds, or, very frequently, of all three.

The Vine frequently suffers from mildew, red-spider, mealy-bug, &c.; the Apple from canker and American blight; the Plum from aphis or green-fly; the Cherry, whether under glass or on the open wall, from the black-fly; while the useful Black Currant is said to be in danger of total destruction from the ravages of the Black Currant-mite (Phytoptus ribis).

The still more useful Gooseberry, in its many varieties, has possibly fewer enemies than some other hardy fruits, still, in common with other out-of-door fruits, it has to contend with the ravages of birds, notably the bullfinch, and for which the gun, although a harsh remedy, is probably the only effective one. The other, and possibly the most formidable enemy to the Gooseberry, is the caterpillar, and few, I think, will experience any scruples in trying to exterminate this troublesome pest.

The caterpillars are supposed to descend, and to bury themselves in the soil under the bushes towards the end of the summer, where they change into the chrysalis state, and so remain until the following spring, when it becomes a fly, and finally deposits its numerous eggs on the under-side of the leaves, where, in little more than a week, the caterpillars are hatched, and immediately commence to feed voraciously upon the leaves. Some very clumsy remedies, if they may be so called, are very frequently applied, with a view to destroy, or to check the ravages of this destructive pest; but many of them are by no means effective, such as the dusting of the bushes with quick or gas lime, or soot, which has the effect of disfiguring the bushes for the greater part of the season, as well as of soiling the fruit, and at the same time fails to have the desired effect. Possibly a much better plan is that of covering the surface of the soil under the bushes with a good dressing of fresh dry soot during the early part of the month of March, or, when the bushes have been pruned. This dressing should be a liberal one, and can do no harm, but will, on the contrary, act as a valuable fertiliser, and will, to some extent, at least, have the effect of preventing the development of the fly. At all events, whenever I have practiced this plan, I have no recollection of ever being seriously troubled with the Gooseberry caterpillar. It is possible that a similar dressing with gas-lime might have a similar effect, but this I have not tried.

In cases where bushes are already attacked by the caterpillar, Hellebore powder, which can be obtained from all chemists at a reasonable rate, will be found to be an infallible remedy; and this may be applied in the form of a decoction with a garden syringe, of about the strength of a pound of the powder soaked in some ten gallons of rain water, which should be allowed to stand about twenty-four hours before being applied; or, possibly a better plan is to apply the powder, which should be perfectly dry, by means

of a common dredger, selecting a still evening for the purpose, and a pound of the powder will be found sufficient for the purpose of dressing a plantation of considerable dimensions, and it is not always that a second dressing is found necessary. It is not necessary that the powder should come into actual contact with the caterpillar, neither does it appear to at once kill it when it does so, as I have known them to be still alive after having been experimentally covered with the powder during several days. It is, however, certain that when a Gooseberry bush, however infested it may be with the pest, is well dusted with the powder, the caterpillar will at once cease to feed on the leaves, and will soon disappear. *P. G.*

HOME CORRESPONDENCE.

SEDUM EWERSII?—In my note on early spring flowers, p. 302, I recommended using Sedum pulchellum as a carpet in which to plant *Leucojums*. I was not sure of the name, and so consulted a first-class authority, who looked at his books, and named it. Some time, I showed pieces of the Sedum to another authority, who believed it to be S. Ewersii; but as there still seemed some doubt, a third was appealed to, who provisionally named it S. hybridum, but required to see the flowers. These Sedums are very puzzling, and, with permission, I will send the name when finally settled. While my note another lovely Iris—I. Rosenbachiana—bloomed on March 10 in our bulb-garden; and about the same time several plants of Tecophæa cyanocrocus, both the blue and blue-and-white forms, all very beautiful. We succeed better with both of these plants in the open air than under glass. Rhododendron præcox superbum, shown in the Kew collection at a recent Horticultural Society's meeting, lasted well this year for some time, but then the hard frost caught the blossoms. This plant should, I think, be grown more, and be placed both in sun and shade, so that some would escape the short frosts so common at this season, owing to the different times of flowering. Our largest plant is 5 feet high, and 5 feet wide, and owing to the habit of free flowering, was very beautiful. Shortia galacifolia in light peaty soil in shade has grown and flowered well. *George F. Wilson, Weybridge.*

SQUIRRELS.—I quite agree with your correspondent, Mr. A. O. Walker, on p. 363, that the squirrel is one of the prettiest of our wild animals, but they are more destructive than he seems to think they are. I have not had much experience as to the damage done by them to Conifers in general, but have watched them feeding on the young growths and cones of the Scotch Fir. In a garden where I lived, they got so numerous, that we were obliged to resort to rather strong measures to lessen their number, such as shooting and trapping them. Round the garden in question stand three or four Scotch Firs overhanging the walls; on these the squirrels were very fond of feeding, and would make quite a litter on the ground beneath the tree of young shoots and the axis of green cones—perhaps they may bite off the shoots to get the more readily to the cones. From these trees they found their way into the garden, and finding plenty of good things to help themselves to, did a lot of damage to fruit and Peas. They will eat Apples, Pears, Apricots, Peaches, Strawberries, &c. Rows of Peas we have had to net to protect from the squirrels. They will do as much damage to Peas as Jay birds, but are more particular in eating them, for they take off the skin of the Peas, leaving them with the pods at the foot of a standard Apple or Pear tree. Some have been caught in the nets, and also in the nets covering Strawberry-beds, which appears to be a favourite fruit with them, for when they are netted, I have seen them jump upon it, and pull the fruit through the mesh. Several have been caught in steel-traps on the top of the garden-wall on their way to the Apricots. I do not wish it to be thought that I am in favour of the wholesale destruction of these pretty little animals, but they should not be allowed to get too numerous in woods and plantations in close proximity to the garden. *J. S. Upex, Wigganthorpe.*

—— I have seen squirrels many times gnawing the leading buds of Conifers over the whole tree, which Mr. A. O. Walker seems to doubt (p. 363); and A. O. W.'s uncle, the late Sir Ed. Walker, had many trees damaged from the same cause at Berry Hill, and I had orders from Sir Ed. to shoot every one I saw, as he too had seen them do so frequently. When the sap begins to rise, and their winter store is getting low, is the time when they are most destructive. *Jas. Hamilton, Berkely Gardens, Burton-on-Trent.*

—— I cannot agree with Mr. A. O. Walker (p. 363), that squirrels do no harm to the leaders of Conifers. I know from actual experience that they do. I have had the leader from several trees of Abies Nordmanniana nibbled off 6 inches from the point, having found them a few minutes afterwards at the foot of the trees, the teeth-marks clearly indicating who was the cause of the mischief. I have watched them, when particularly active, among the succulent flower-buds of Horse-Chestnuts, and have seen remains of the shoots drop from the trees. There is a vast difference between the loss of a leader of any of the Pine tribe by disease, and from the teeth of the active squirrel, which any one can determine. I admire the squirrel for its antics and appearance, but cannot see trees denuded of their leaders and bloom-buds to satisfy a sentimental fancy, and I, therefore, shoot all I can find without the slightest pang of remorse. *E. M. Molyneux, Swanmore.*

COMPARATIVE HARDINESS OF TEA ROSES.—The notes of Mr. Jas. Simpson, on p. 366, are a valuable addition upon this matter; but I believe that it is the experience of a large majority of Rose growers that they lose more Teas than Hybrid Perpetuals in severe weather. At Broughty Ferry we are told that Teas and hybrid perpetuals withstand severe frost; but we must remember that, owing to the nearness of the sea, changes of temperature would be more gradual than they are in many localities. Here in the valley of a great river, there is often late in spring a great variation of temperature between 3 P.M. and 9 A.M., and this at a time when the vital cells twixt bark and wood are flushed with sap, seems to me to be the chief cause of death. Starting buds and old trees are then, in some winters, as in that of 1889-90, killed; but the injury is always greater amongst the Teas than amongst the hybrid perpetuals. If, then, one's Rose garden must be beyond the neutralising effects upon changes of temperature which the ocean exercises, an inland site with a fair altitude should be sought. *Will Tayler, Hampton, Middlesex.*

FIG. 58.—ABRAXIS GROSSULARIATA: THE GOOSEBERRY CATERPILLAR. (SEE P. 392.)

BRITISH AND AMERICAN APPLES.—I see in Mr. Thomas's reply (p. 333) to my note, the word "Impossible!" and that no such sudden fall took place in Apples as I mentioned at the dates named, and that there must have been a blunder on the part of the salesman or his clerk. He suggests that the Apples were sent in bushels, and that the error was entering a half-bushel instead of a bushel. That cannot be, for I have never sent an Apple in bushel baskets, only half-bushel ones. Assuming that it had been a clerical error in some way or other, how is it that on December 13, Blenheims, 3*s.*, Cox's Orange, 2*s.*; December 17, Cox's Orange, 3*s.*; December 21, Cox's Orange, 3*s.* per bushel (exactly the same sample as sent to you, Mr. Editor). These are the exact facts, and not easily explained. Mr. Thomas says the buyer "or myself" was taken in by paying 40*s.* per barrel for Americans. I should not think of buying these fruits when I had plenty of home-grown Apples of far better quality. Why does he not put this down to a clerical error? Thus, 14*s.* per barrel instead of 40*s.* He says the public disputes the fact that 1 lb. of home-grown equals three of imported ones. That brings me to my remark that the public hankers after foreign fruit, and that there must be a training and cultivation of taste, and when these desirable consummations take place, I will venture to say that we shall then soon checkmate the foreigner, and having done so, we can take the offensive, and invade his markets. It is simply a question of time before the superior products of our hot-houses and fruit gardens will be seen on sale in New York, Paris, Berlin, Vienna, St. Petersburg, and Madrid. This, of course, will be when the railway and shipping companies do for us what they have already done for the foreigner, namely, run special trains, fast steamboats, and give preferential rates for our productions. I am sorry Mr. Thomas still asserts that old trees cannot be made to produce fine fruit. I should be pleased to show him bushels of fine and well-coloured fruit of Blenheim Orange which came from trees at least forty-five years old, and I should advise gardeners to pause before condemning old trees, if healthy, just for the sake of planting new ones, as they may depend upon it, the returns will be much larger if they are treated in the manner that I advocated. Further on, he says, if I depend on the grafted trees, I am not alive to the requirements of the times. Allow me to inform Mr. Thomas that I have planted here 176 varieties of Apples, also 125 sorts of Pears, in various forms, such as cordons, pyramids, espaliers, dwarf and tall standards, for comparisons as to quality, suitability to our soil, aspect, and elevation. Many out of this number have proved worthless and many more I have found are synonymous; so that now the selection has brought down the list to about twenty-five varieties—and these we have planted in quantity, and now cover twelve orchards, some in full-bearing, others coming on. As time rolls on, in good years, there will be Apples to gather, not by hundreds of bushels, but by thousands. This, I think, is a proof that we are somewhat alive. Fashions change in fruit as well as in flowers and clothes. A gentleman said to me some years ago, what is the use of growing Nectarines? very few ladies eat them, but everyone eats Peaches. A few years after he remarked that it was fortunate that the Nectarines were not cleared out, people's taste had changed, and everyone wanted Nectarines—that is not the only case in point. Melons, Pines, &c., are the same. In some seasons there is a greater demand than in others, even when the seasons are but alike as regards temperature, &c. But I contend that if people will only study the qualities of house-grown as well as hardy fruit and buy them on their merits, British products will always hold their own, and permit us to successfully compete with foreigners in their own markets. It is utterly absurd to compare any fruits raised in any other country with those grown in the United Kingdom. The imported Tomatos are simply bags of tasteless seeds and skin, compared with those grown in quantities in the districts of Worthing and other places in the south. Apples from France, Germany, and Spain, are already at a discount. The pale, watery, flavourless Strawberry, sent from Russia, will not compare with Paxton, President, and British Queen, grown in Kent. *A. Evans, Homewood.*

TECOPHILÆA CYANOCROCUS.—This is one of the prettiest spring plants in flower here now. Though not generally supposed to be hardy, it is perfectly so. It has been planted out here for three years, and has come on stronger each year. The bulbs were planted about 4 inches deep, in ordinary garden soil, on a slope facing the south, in full sun. In winter they have had the protection of a slight mulching. The flowers, which usually come up in pairs, are about 4 inches high, of an intense blue, and a clump, with five or six of them expanded, at this time of the year makes a very beautiful picture. The plant seeds freely, and it may easily be increased in this way. *T. E. D., Norwich.*

CHRYSANTHEMUMS FOR TRAINING.—If "A. G. B." has not the plants already established in 4-inch pots, success cannot be obtained this season. Striking the cuttings early in December is the practice generally adopted in cultivating Chrysanthemums in the manner required by your correspondent. During all stages of their growth the plants should enjoy cool quarters. Heat renders the growth weak, and the leaves thin in substance, and as the foliage is of the utmost importance in

specimen plants, care ought to be taken to have it in good condition. For standards the growth should be restricted to one stem until the desired height is attained—3 feet or 3 feet 6 inches—when it should be topped. If the plants grow to this height before making their natural first break, so much the better, but if a break occurs earlier the shoots must be reduced to one, which is allowed to grow till the necessary height is reached. The topping induces other side shoots to form, which makes the foundation of the future head. Reduce these shoots to four, and when they have grown 6 inches long again stop them, continuing the stopping until the requisite number of branches is obtained to cover the trellis, but topping should not take place later than the middle of June. The number of flowers each plant is expected to produce must guide the cultivator as to the number of times the shoots should be stopped. It is a mistake to attempt to produce too many blooms on one plant. Plants of the small-flowered varieties of incurved, such as Mrs. G. Rundle, if the heads are grown, say, about 2 feet in diameter, and about 1 foot 4 inches deep, fifty blooms will be enough, but in the case of larger sorts, like Prince Alfred for instance, thirty flowers would be ample. The best varieties for standards in the incurved section are Mrs. G. Rundle, George Glenny, Mrs. Dixon, Prince Alfred, Lord Wolseley, and Jardin des Plantes; Japanese:—Roseum superbum, Fair Maid of Guernsey, Maiden's Blush, Bouquet Fait, and Hiver Fleuri. Pyramids require a long season of growth also. The leading shoot should be stopped at about 9 inches, the best shoot following being taken as a leader again, and the side branches trained out regularly. All topping should be done before the first week in July. Plants 3 feet high, and 2 feet through at the base, are large enough if furnished well with good foliage and blooms. As to varieties, the Rundle family are the best for this form of training. Pompons are also well suited, being free both in growth and flowering. The treatment required for dwarf plants is applicable to those trained flat, excepting that the latter should have the shoots depressed more to keep the plants dwarf. The same varieties will be suitable. The first stopping should take place when the plants are 4 inches high, to induce the production of side-shoots, to form the basis of the future specimen. Stopping ought not to be continued after the middle of June. A limited number of blooms to each plant, so as to have them really fine, is preferable to a larger number of inferior quality. Of great importance is the timely attention to, and destruction of, insect pests, such as green and black-fly, the Celery-leaf maggot, and a species of green caterpillar that infests the young shoots. Mildew is at times troublesome; the leaves affected should be at once dusted with flowers-of-sulphur. The three varieties of the Rundle family, Lord Wolseley, Prince Alfred, John Salter, Prince of Wales, Lord Derby, and Mrs. Sharpe are suitable sorts in the incurved section; while Mdlle. Lacroix, Hiver Fleuri, Bouquet Fait, Peter the Great, Fair Maid of Guernsey, Madame Bertier Rendatler, Maiden's Blush, Mons. Bernard, and Elaine will represent the Japanese section very well. *E. Molyneux.*

LACHENALIA TRICOLOR.—This Cape bulb is worthy of more extended cultivation than seems to be at present accorded to it. Recently, when there was a large house-party here, we had a few pots on the dinner-table. The next day I was requested to write the name down for the general information of the guests, not one of whom had ever seen it before. Its cultivation is very simple. Anyone in possession of a greenhouse may have a display of its beautiful flowers from the middle of January on through February and March. We place six bulbs in a 5-inch pot, using a compost of two parts loam to one of leaf soil, with the addition of a little decayed manure and sand. The potting material should be in a medium state of moisture, so that watering may not be required until the pots are removed from the plunging material. After potting, they are plunged in leaf soil in an open shed, or in a cold frame, from which they are taken when they have made half-an-inch of growth; they are then gradually inured to the light, and kept in a cold frame until the approach of frost, when they are placed in a cool structure. From here they are taken in batches to a temperature of 45° to 50°, in which they soon push up their flower spikes. After flowering, place them in the full sun, and feed them liberally until the leaves show signs of ripening, when the feeding must stop, and water be afforded more sparingly until the leaves ripen off thoroughly; afterwards they may be stored away in a cool dry shed until the beginning of August, when they should be potted again. *J. Tunnington, Ripley Castle Gardens.*

FREESIAS.—I was pleased to see Mr. Ward's note on the above. There can be no doubt as to their beauty, fragrance and usefulness—neither is there any doubt that their cultivation is not so extensive as it deserves to be. I was not aware, until perusing the article in question, that they would yield their lovely flowers so abundantly in 3-inch pots, especially with so many as seven corms in each, and shall certainly try a few in pots of the dimensions recommended in future, and if I am as successful as Mr. Ward appears to be, shall adopt the practice. Well-flowered pots of the size named might be used to advantage in dinner-table decorations. At present we grow ours twelve corms in a 6-inch pot, using similar compost to that recommended at p. 174, but instead of plunging the pots in ashes out-of-doors, they are plunged in leaf-soil in a cold frame. The time of potting is end of July or beginning of August. I find F. Leichtlini major a better doer than F. refracta alba, the flower-spikes are stronger, and throw out lateral sprays more freely, thus a few pots give a long succession of bloom. In potting, only the largest bulbs are placed into the flowering pots, the smaller ones being sown rather thickly in pans to increase in size for flowering another season. *J. Tunnington, Ripley Castle Gardens.*

SPRING FLOWERS IN REGENT'S PARK.—The early spring flowers are very beautiful in this park, more so than in any other of the London parks. Chionodoxas, Scillas, Narcissi, Crocuses, and other early-flowering bulbs are planted freely, each kind in large breadths, the flowers hiding the grass. The whole park seems full of colour, even at this early season, and a fine display of Hyacinths and Tulips may be anticipated, judging by the healthy aspect of the bulbs. *V.*

BROCCOLI.—I have a bed of Broccoli containing 284 plants, which are about equally divided in the following varieties, Veitch's Main Crop, Late Queen, Ledsham's Latest of All, Veitch's Model, Penzance, and Dilcock's Bride. Only eighteen plants have been destroyed by the frost; they are planted on a border on the west side of a wall, and my experience is they stand the winter best in that position, as the frost is off the plants before the sun shines on them powerfully. I have two other varieties planted in an exposed place, and nearly half are killed. *R. Edwards, Beechy Lees, Otford, Kent.*

EARLY-FLOWERING SNOWDROPS, ETC.—The enclosed is our record of early-flowering of Snowdrop, Crocus, and Winter Aconite for the years from 1888 to present date. Is the blue Crocus always earliest? [No.] It is so here, and it is planted on all sides with white-striped and pure yellow. But the blue ones are at least a fortnight before the others. These are all planted in a grass bank under trees, and where the earliest Aconite and Crocus grow it is kept mown as any other part of the lawn, except in early summer, when the grass is allowed to grow till such time as the foliage of the Crocus and other things are ripe; then it is cut and kept short the rest of the year. I notice that among the list of plants given by Mr. May he has omitted two very fine things—the double white Wood Anemone and the Dog-tooth Violet; we have both naturalised here, and beautiful they are, especially the Violets. We also have a beautiful white (double) Saxifrage, which is quite at home under Beech trees, where so few things will exist in any shape, much less flower; but here the ground is quite white with the beautiful large double-white flowers.

Description.	1888.	1889.	1890.	1891.	1892.	1893.
Snowdrops ...	Jan. 10	Dec. 15	...	Jan. 25	Jan. 20	Jan. 23
Crocus	Jan. 26	Dec. 17	...	Jan. 25	Jan. 28	Feb. 3
Winter Aconite ...	Jan. 21	Jan. 27	Jan. 15	Feb. 4	Jan. 25	Jan. 27

The dates of Snowdrop and Crocus were not taken in 1890. *John Page, Monteviot.*
